GENERAL:
ALL SET POINTS, SOFTWARE TIMERS, ALARM PARAMETERS SHALL BE ADJUSTABLE AND COORDINATED WITH OWNER.

AIR HANDING UNIT (REFER TO M4.00 FOR AIR HANDLING UNIT DIAGRAM)
1. OVERVIEW
1.1. THE AIR HANDLING UNIT SHALL BE CONTROLLED BY A LOCAL STANDALONE BAS CONTROL PANEL.
1.2. EQUIPMENT AND CONTROLS SHALL BE WIRED TO EMERGENCY POWER. PROVIDE AUTOMATIC RE-START UPON POWER FAILURE AND UPON RETURN TO NORMAL POWER.
1.3. AT A MINIMUM, ALL VAV TERMINAL UNITS SERVED BY AN AHU SHALL BE LINKED WITH ASSOCIATED VAV AHU CONTROLLER TO PERFORM THE FOLLOWING FUNCTIONS: OCCUPANCY SCHEDULING, STATIC PRESSURE SETPOINT RESET, DISCHARGE AIR TEMPERATURE RESET.

2. COMPONENT OPERATION

2.1. SUPPLY FAN
2.1.1. EACH SUPPLY FAN HAS BACKDRAFT DAMPER TO LIMIT LAG FAN FROM ALLOWING SUPPLY AIR TO SHORT CIRCUIT. DESIGN IS BASED UPON FAN OPEREATING AND ONE FAN AS REDUNDANT. AFTER LEAD SUPPLY FAN IS STARTED AND PROVEN RUNNING AT MINIMUM SPEED (ADJUSTABLE), THE SUPPLY FAN VARIABLE FREQUENCY DRIVE(S) SHALL MODULATE TO MAINTAIN A STABLE DUCT STATIC PRESSURE SETPOINT AS SENSED AT LEAST TWOTHIRDS OF THE WAY DOWNSTREAM OF THE SUPPLY FAN IN THE LONGEST OR MOST CRITICAL DUCT. UPON INITIAL STARTUP, FAN SPEED SHALL BE RAMPED SLOWLY FROM MINIMUM SPEED TO OPERATING SPEED WITHIN A 5 MINUTE PERIOD.
2.1.2. THE SUPPLY FAN VFD MINIMUM SPEED SETTING WITHIN THE VFD ITSELF SHALL BE OPTIMIZED IN THE FIELD DURING SYSTEM BALANCING AND COMMISSIONING TO BE AS LOW AS POSSIBLE TO MEET THE MINIMUM FLOW REQUIREMENTS FOR MOTOR COOLING.

2.2. RETURN FAN
2.2.1. THE RETURN FAN(S) SHALL OPERATE WHENEVER THE SUPPLY FAN(S) ARE OPERATING AND PROVEN RUNNING.
2.2.2. EACH RETURN FAN HAS BACKDRAFT DAMPER TO LIMIT LAG FAN FROM ALLOWING RETURN AIR TO SHORT CIRCUIT. DESIGN IS BASED UPON ONE FAN OPERATING AND ONE FAN AS REDUNDANT. AFTER THE LEAD RETURN FAN IS STARTED AND PROVEN RUNNING AT MINIMUM SPEED (ADJUSTABLE), THE RETURN FAN VARIABLE FREQUENCY DRIVE(S) SHALL MODULATE TO MAINTAIN A STABLE RETURN DUCT STATIC PRESSURE SETPOINT AS SENSED AT LEAST TWOTHIRDS OF THE WAY UPSTREAM OF THE RETURN FAN IN THE LONGEST OR MOST CRITICAL DUCT. UPON INITIAL STARTUP, FAN SPEED SHALL BE RAMPED SLOWLY FROM MINIMUM SPEED TO OPERATING SPEED WITHIN A 5 MINUTE PERIOD.
2.2.3. THE RETURN FAN VFD MINIMUM SPEED SETTING WITHIN THE VFD ITSELF SHALL BE OPTIMIZED IN THE FIELD DURING SYSTEM BALANCING AND COMMISSIONING TO BE AS LOW AS POSSIBLE TO MEET THE MINIMUM FLOW REQUIREMENTS FOR MOTOR COOLING.

2.4. DISCHARGE AIR TEMPERATURE CONTROL
2.4.1. DISCHARGE AIR TEMPERATURE SHALL BE CONTROLLED TO THE DISCHARGE AIR SETPOINT USING A PID LOOP THAT SEQUENCES THE HEATING COIL VALVE, ECONOMIZER AIR DAMPER, RETURN AIR DAMPER, AND CHILLED WATER COIL VALVE AS NECESSARY TO MAINTAIN A STABLE DISCHARGE AIR TEMPERATURE AT THE SETPOINT AND PREVENTS SIMULTANEOUS HEATING AND COOLING. LIMITS PLUS-MINUS 2F.
2.4.2 DISCHARGE AIR TEMPERATURE SETPOINT FOR THE C-SECTION SHALL MODULATE THE C-SECTION CHILLED WATER COIL VALVE

2.5. DAMPER CONTROL
2.5.1. ECONOMIZER OPERATION SHALL BE AVAILABLE WHEN THE OUTSIDE AIR ENTHALPY IS LESS THAN RETURN AIR ENTHALPY. IF THE OUTSIDE AIR ENTHALPY IS GREATER THAN THE RETURN AIR ENTHALPY, ECONOMIZER OPERATION SHALL NOT BE AVAILABLE.
2.5.2. WHEN ECONOMIZER MODE IS AVAILABLE, THE ECONOMIZER AIR DAMPER SHALL MODULATE OPEN TO 100% AS THE FIRST SOURCE OF COOLING TO MAINTAIN THE DISCHARGE AIR TEMPERATURE SETPOINT.

2.6. SETPOINT RESETS
2.6.1. DISCHARGE AIR TEMPERATURE RESET
2.6.1.1. FOR ENERGY EFFICIENCY, THE TEMPERATURE SETPOINT SHALL BE RESET IN 1 (ADJ) DEG INCREMENTS USING TRIM & RESPOND LOGIC AT A FREQUENCY OF ONCE EVERY 10 MINUTES SUCH THAT THE AHU PROVIDES THE MOST ECONOMICAL AIR TEMPERATURE POSSIBLE TO SATISFY THE VAVS DEMANDS. SETPOINT SHALL NOT BE ALLOWED TO EXCEED 65F OR DROP BELOW THE DESIGN DISCHARGE AIR TEMPERATURE. WHEN THE AHU HEATING COIL IS OPERATING, THE TEMPERATURE SETPOINT SHALL BE 55F.
2.6.1.2. THE BAS SYSTEM SHALL MONITOR COOLING SIGNAL AND HEATING SIGNAL OF ALL VAVS (TERMINAL UNITS) SERVED BY THE AHU. WHEN A COOLING SIGNAL EXCEEDS 90%, IT SHALL BE COUNTED AS A "COOLING REQUEST", WHEN THE COOLING SIGNAL IS LESS THAN 75%, IT SHALL NOT BE COUNTED. WHEN A VAV HEATING SIGNAL EXCEEDS 90%, IT SHALL BE COUNTED AS A "HEATING REQUEST". WHEN THE HEATING SIGNAL IS LESS THAN 75%, IT SHALL NOT BE COUNTED. THE CAPABILITY FOR THE USER TO OPTIONALLY DESIGNATE ZONES AS PRIORITY ZONES OR CRITICAL ZONES SHALL BE PROVIDED. FOR PRIORITY ZONE VAVS, EACH RESPECTIVE "REQUEST" SHALL BE COUNTED AS TWO "REQUESTS". AS THE "REQUEST" COUNTS INCREASES, THE RESET SHALL INCREMENTALLY RESPOND WITH AN INCREASING MAGNITUDE FOR EACH ADDITIONAL "REQUEST". WHEN A COOLING REQUEST IS RECEIVED FROM A CRITICAL ZONE, THE SETPOINT SHALL BE RESET COOLER. WHEN A HEATING REQUEST IS RECEIVED FROM A CRITICAL ZONE, THE SETPOINT SHALL BE RESET WARMER.
INITIAL SETUP SHALL INCLUDE THE C-SECION ROOM AS PRIORITY ZONE.
2.6.1.3. IF THERE ARE ZERO COOLING REQUEST AND MORE THAN ONE HEATING REQUEST, THE SETPOINT SHALL BE INCREMENTALLY RESET WARMER. IF THERE ARE ZERO HEATING REQUEST AND MORE THAN ONE COOLING REQUEST, THE SETPOINT SHALL BE INCREMENTALLY RESET COOLER.
2.6.1.4. IF THERE IS EXACTLY ONE MORE HEATING REQUEST THAN COOLING REQUESTS, THE SETPOINT SHALL HOLD IN PLACE AND NOT RESET. IF THERE IS EXACTLY ONE MORE COOLING REQUEST THAN HEATING REQUESTS, THE SETPOINT SHALL HOLD IN PLACE AND NOT RESET. IF THERE ARE 3 OR MORE REQUESTS FOR COOLING THEN THE HEATING THE SETPOINT SHALL BE INCREMENTALLY RESET COOLER. IF THERE ARE 3 OR MORE REQUESTS FOR HEATING THEN THE COOLING THE SETPOINT SHALL BE INCREMENTALLY RESET WARMER.
2.6.1.5. IF ZERO HEATING REQUEST AND ZERO COOLING REQUEST AND RETURN AIR DAMPER IS LESS THAN 85% OPEN, THEN INCREMENTALLY RESET WARMER UNTIL ONE COOLING REQUEST IS MAINTAINED OR UNTIL THE RETURN AIR DAMPER REACHES 85% OR MORE OPEN. IF ZERO HEATING REQUEST AND ZERO COOLING REQUEST AND RETURN AIR DAMPER IS OPERATING AT GREATER THAN 95%, THEN INCREMENTALLY RESET COOLER UNTIL ONE HEATING REQUEST IN MAINTAINED OR UNTIL THE RETURN AIR DAMPER REACHES 95% OR LESS.
2.6.1.6.IN THE EVENT OF LOSS OF COMMUNICATION WITH ANY VAV CONTROLLERS THE SYST EM SHALL NOT INCLUDE THEM IN THE CALCULATION. THE CALCULATION WILL HAVE CAPABILITY TO SELECT HOW MANY BOXES ARE USED IN THE ROUTINE TO DEAL WITH PROBLEM VAV CONTROLLERS.
2.6.2. STATIC PRESSURE SETPOINT RESET
2.6.2.1. FOR ENERGY EFFICIENCY, BOTH THE SUPPLY AND RETURN STATIC SETPOINTS SHALL BE RESET USING TRIM & RESPOND LOGIC SUCH THAT THE SUPPLY AND RETURN OR RELIEF FANS OPERATE AT THE SLOWEST POSSIBLE SPEED NECESSARY TO SATISFY THE ASSOCIATED VAV'S DEMANDS.
2.6.2.2. THE BAS SYSTEM SHALL MONITOR THE DAMPER POSITIONS OF ALL VAVS SERVED BY THE AHU. WHEN A VAV DAMPER EXCEEDS 90% OPEN, IT SHALL BE COUNTED AS A "REQUEST" FOR MORE STATIC. WHEN THE VAV DAMPER IS LESS THAN 75% OPEN, IT SHALL NOT BE COUNTED. FOR CRITICAL ZONE VAVS, THE "REQUESTS" SHALL BE COUNTED AS TWO "REQUESTS". AS THE "REQUEST" COUNT INCREASES, THE RESET SHALL INCREMENTALLY RESPOND WITH AN INCREASING MAGNITUDE FOR EACH ADDITIONAL "REQUEST".
2.6.2.3. AT A FREQUENCY OF ONCE EVERY 10 MINUTES, THE ASSOCIATED DUCT STATIC PRESSURE SETPOINT SHALL BE INCREMENTALLY RESET UPWARD UNTIL THE SUM OF ALL "REQUESTS" IS ONE OR LESS, OR THE SETPOINT HAS RESET TO THE MAXIMUM LIMIT ESTABLISHED BY THE TAB CONTRACTOR.
2.6.2.4. WHEN THE SUM OF ALL "REQUESTS" IS ZERO THE ASSOCIATED FAN DUCT STATIC PRESSURE SETPOINT SHALL BE RESET DOWNWARD INCREMENTALLY UNTIL THE SUM OF ALL "REQUESTS" IS ONE OR MORE OR THE SETPOINT HAS RESET TO THE MINIMUM LIMIT ESTABLISHED BY THE TAB CONTRACTOR.
2.6.2.5. IN THE EVENT OF LOSS OF COMMUNICATION WITH ANY VAV CONTROLLERS THE SYSTEM SHALL NOT INCLUDE THEM IN THE CALCULATION. THE CALCULATION WILL HAVE CAPABILITY TO SELECT HOW MANY BOXES ARE USED IN THE ROUTINE TO DEAL WITH PROBLEM VAV CONTROLLERS.
2.6.2.6. MAX DUCT STATIC PRESSURE SETPOINT SHALL BE DETERMINED BY THE TAB CONTRACTOR AS THE DUCT STATIC PRESSURE VALUE REQUIRED TO SATISFY ALL TERMINAL UNITS UNDER PEAK LOAD CONDITIONS. ALARM AT 90% OF MAXIMUM DUCT STATIC TO MINIMIZE SHUTDOWNS UNLESS ABSOLUTELY NECESSARY, PROVIDE SLOW RESPONSE TO MINIMIZE NUSENCE TRIPPING.

2.7. DEHUMIDIFICATION
2.7.1. IF THE RELATIVE HUMIDITY IN ANY ROOM ASSOCIATED WITH THE UNIT EXCEEDS 60%, THE DEHUMIDIFICATION MODE SHALL BE ENABLED. WHEN THE DEHUMIDIFICATION MODE IS ENABLED, THE COOLING COIL SUB-COOLS THE AIR BELOW THE DISCHARGE AIR TEMPERATURE SETPOINT TO REMOVE MOISTURE FROM THE AIR. THE DISCHARGE AIR TEMPERATURE SETPOINT DURING DEHUMIDIFICATION MODE SHALL BE OVERRIDDEN TOWARD 51 F, STEPPED DOWN FROM CURRENT SETPOINT BY 1F AT 10 MINUTE INTERVALS, TERMINAL UNITS SHALL PROVIDE SPACE HEATING REQUIREMENTS.

2.8 HUMIDIFICATION
1.1. SYSTEM CONSISTS OF AN ELECTRIC STEAM HUMIDIFIER AND DUCT MOUNTED NOZZLES WITH ASSOCIATED FACTORY AIRFLOW SWITCH AND HIGH HUMIDITY CUTOUT DEVICES.
1.2. HUMIDIFIER SHALL BE ENABLED BY THE BAS ANY TIME THE ASSOCIATED AHU IS RUNNING.
1.3. THROUGH A DEMAND SIGNAL TO THE HUMIDIFIER, THE BAS SHALL MODULATE THE HUMIDIFIER AS NEEDED TO MAINTAIN THE ROOM HUMIDITY AT 40%.
1.4. ROOM HUMIDITY SENSOR
1.4.1. THE BAS SHALL CONTINUALLY MONITOR THE ROOM RELATIVE HUMIDITY
1.5. FACTORY HIGH HUMIDITY CUTOUT
1.5.1. UPON DETECTION OF DUCT HUMIDITY LEVELS IN EXCESS OF 75%, THE HUMIDIFIER OPERATION SHALL BE INTERRUPTED UNTIL DUCT HUMIDITY LEVELS DROP BACK BELOW 65%.
1.6. FACTORY AIR FLOW SWITCH
1.6.1. THE DUCT MOUNTED AIR FLOW SWITCH SHALL NOT ALLOW THE HUMIDIFIER TO OPERATE UNLESS SUFFICIENT AIRFLOW IS CONTINUALLY PROVEN.
1.7. SAFETIES AND ALARMS
1.7.1. THE BAS SHALL MONITOR THE STATUS OF THE BOILER FAULTS AND ALARMS AND IF HUMIDIFIER IS INTERRUPTED DUE TO HIGH HUMIDITY CUTOUT OUR AIRFLOW PROVING SWITCH, THEN AN ALARM SHALL BE GENERATED AT THE BAS.
1.7.2. AN ALARM SHALL BE GENERATED AT THE BAS IF ROOM HUMIDITY EXCEEDS 60% OR DROPS BELOW 30% FOR MORE THAN 5 MINUTES.

6. SAFETIES
6.1. FREEZE PROTECTION
6.1.1. IF THE COOLING COIL TEMPERATURE DROPS BELOW 40°F FOR 5 MINUTES, ALLOW THE ECONOMIZER DAMPER TO MODULATE TO FULLY CLOSED AS NECESSARY TO MAINTAIN A DISCHARGE AIR TEMPERATURE ABOVE 40°F.
6.1.2. IF THE COOLING COIL TEMPERATURE DROPS BELOW 34°F FOR 10 MINUTES, SHUT DOWN SUPPLY AND RETURN FANS, CLOSE OUTDOOR AIR DAMPERS.

6.2.1. ON DETECTION OF SMOKE FROM THE UNIT OR DUCT-MOUNTED SMOKE DETECTORS OR ON SIGNAL FROM THE FIRE ALARM SYSTEM, THE SUPPLY AND RETURN FANS SHALL BE STOPPED VIA A HARDWIRE SAFETY SHUTDOWN.
6.2.2. THE MINIMUM, ECONOMIZER AIR AND EXHAUST AIR DAMPERS WILL BE CLOSED AND THE RETURN AIR SHALL OPEN TO 100%. THE COOLING COIL VALVE WILL BE CLOSED. THE HEATING COIL VALVE SHALL MODULATE TO MAINTAIN A HEATING COIL TEMPERATURE ABOVE 40°F.

6.3. LOW/HIGH STATIC PRESSURE
6.3.1. ON DETECTION OF EITHER LOW OR HIGH STATIC PRESSURE SWITCH TRIP IN THE SUPPLY AIR OR RETURN AIR DUCTWORK, THE SUPPLY AND RETURN FANS SHALL BE STOPPED VIA A HARDWIRE SAFETY SHUTDOWN WITH A MANUAL RESET BUTTON.
6.3.2. INITIAL SETPOINTS SHALL BE 4" WC. FOR THE STATIC PRESSURE HIGH LIMIT AND NEGATIVE 4" WC. FOR THE LOW STATIC PRESSURE LIMIT. PROVIDE BOTH DIGITAL AND ANALOG SENSORS AT HIGH SAFETY SWITCH LOCATION.

AS THE AIRFLOW INCREASES ABOVE SETPOINT THE TERMINAL UNIT DAMPER MODULATES CLOSED TO DECREASE AIRFLOW.
2.1.2. COOLING MODE
2.1.2.1. THE CONTROLLER MONITORS THE ROOM TEMPERATURE SENSOR AND AIR VELOCITY SENSOR AND MODULATES THE TERMINAL UNIT DAMPER TO THE SCHEDULED MINIMUM AIRFLOW TO MAINTAIN THE OCCUPIED COOLING SETPOINT. AS THE ROOM TEMPERATURE INCREASES ABOVE SETPOINT THE DDC CONTROLLER COOLING SIGNAL INCREASES AND THE AIR VOLUME SETPOINT INCREASES TO THE SCHEDULED MAXIMUM AIRFLOW SETPOINT. AS THE CALL FOR COOLING DECREASES THE AIR VOLUME SETPOINT DECREASES TO THE SCHEDULED MINIMUM AIRFLOW SETPOINT.
2.1.3. HEATING MODE
2.1.3.1. THE CONTROLLER MONITORS THE ROOM TEMPERATURE SENSOR AND AIR VELOCITY SENSOR AND MODULATES THE TERMINAL UNIT DAMPER TO THE SCHEDULED MINIMUM AIRFLOW TO MAINTAIN THE OCCUPIED HEATING SETPOINT. AS THE ROOM TEMPERATURE DECEASES BELOW SETPOINT THE DDC CONTROLLER HEATING SIGNAL INCREASES AND THE REHEAT CONTROL VALVE MODULATES OPEN TO MAINTAIN THE ROOM TEMPERATURE AT SETPOINT. AS THE CALL FOR HEATING DECREASES THE REHEAT CONTROL VALVE MODULATES CLOSED TO MAINTAIN THE ROOM TEMPERATURE AT SETPOINT.
2.2. UNOCCUPIED
2.2.1. THE CONTROLLER SHALL CLOSE THE TERMINAL UNIT DAMPER TO THE TERMINAL UNIT. THE DDC CONTROLLER SHALL MONITOR THE ROOM TEMPERATURE SENSOR AND SHALL BE CONTROLLED IN EITHER COOLING OR HEATING MODES TO MAINTAIN THE SPACE AT THE UNOCCUPIED COOLING AND HEATING SETPOINTS, PROVIDE MORNING WARMUP, COOLDOWN AND VENTILATION PURGE SEQUENCES PRIOR TO THE SCHEDULED OCCUPIED START TIMES.

FIRE ALARM GENERAL NOTES

A. PROVIDE A COMPLETE DESIGN/BUILD FIRE ALARM PACKAGE IN ACCORDANCE WITH ALL CODES, REGULATIONS AND LOCAL AHJ.
B. AT SUCH TIME THAT A PHYSICAL CONNECTION IS MADE BETWEEN EXISTING AND NEW CONSTRUCTION WHEREBY THE NEW CONSTRUCTION BECOMES PART OF THE EXISTING BUILDING OR WHEN THE FIRE SEPARATION BETWEEN EXISTING AND NEW CONSTRUCTION IS REMOVED, PROVIDE A TEMPORARY FIRE ALARM SYSTEM SIMILAR TO THAT DESCRIBED ABOVE INCLUDING PULL STATIONS, NOTIFICATION DEVICES, HEAT DETECTORS, MONITOR MODULES AND POWER SUPPLIES. TEMPORARY FIRE ALARM PROVISIONS SHALL BE MONITORED BY THE EXISTING FIRE ALARM SYSTEM. MAINTAIN TEMPORARY SYSTEMS IN OPERATION UNTIL PERMANENT FIRE ALARM EQUIPMENT IS INSTALLED, CONNECTED TO THE EXISTING SYSTEM, AND PLACED INTO OPERATION.
C. FIRE ALARM CONDUCTORS AND CABLES SHALL BE ENCLOSED IN METAL CONDUIT. FIRE ALARM CONDUIT SHALL BE IDENTIFIED BY RED PAINT.
D. AUDIBLE NOTIFICATION APPLIANCES SHALL GENERATE PRIVATE MODE SOUND PRESSURE LEVELS UNLESS OTHERWISE NOTED.
E. REFER TO MECHANICAL, PLUMBING AND FIRE PROTECTION DRAWINGS FOR DUCT DETECTORS, SMOKE DAMPERS, TAMPER SWITCHES, FLOW SWITCHES, PRE-ACTION OR DRY-TYPE SPRINKLER SYSTEMS REQUIRED TO BE MONITORED OR CONTROLLED BY THE FIRE ALARM SYSTEM.
F. PROVIDE DUCT-MOUNTED SMOKE DETECTORS AS INDICATED ON THE MECHANICAL DOCUMENTS. PROVIDE CEILING MOUNTED REMOTE INDICATOR AT EACH DUCT DETECTOR.

SEE MECHANICAL DOCUMENTS FOR LOCATIONS OF DAMPERS AND DUCT MOUNTED SMOKE DETECTORS.
H. PROVIDE FIRE ALARM CONNECTIONS TO HVAC SYSTEM CONTROLS AND DEVICES FOR PROPER OPERATION, INCLUDING SHUTDOWN. SEE MECHANICAL DOCUMENTS FOR QUANTITIES, LOCATIONS, AND ADDITIONAL REQUIREMENTS. UPON DETECTION OF FIRE IN ANY AREA OF THE BUILDING (SMOKE, HEAT, OR SPRINKLER FLOW) THE FIRE ALARM SYSTEM SHALL CAUSE THE AIR HANDLER OR AIR HANDLERS SERVING THE SMOKE COMPARTMENT WHERE THE ALARM INITIATED TO SHUTDOWN. THE EXHAUST FANS ASSOCIATED WITH THAT SMOKE COMPARTMENT TO SHUT DOWN, AND ALL SMOKE DAMPERS ASSOCIATED WITH THOSE FANS TO CLOSE. REFER TO ARCHITECTURAL PLANS FOR THE BOUNDARIES OF SMOKE COMPARTMENTS, AND REFER TO MECHANICAL DUCT PLANS FOR WHICH FANS SERVE EACH SPACE. SEE SPECIFICATIONS FOR ADDITIONAL REQUIREMENTS FOR THE SEQUENCE OF OPERATION OF THE FIRE ALARM SYSTEM.
I. FIRE ALARM CONTROL AND MONITORING, INCLUDING AIR HANDLER SHUTDOWN AND DAMPER CLOSURE SHALL BE ACCOMPLISHED USING SUPERVISED FIRE ALARM WIRING TO WITHIN THREE FEET OF THE DEVICE BEING CONTROLLED OR MONITORED. FOR THE PURPOSE OF THIS MEASUREMENT ON AIR HANDLERS, THE MOTOR STARTER OR VFD IS THE DEVICE BEING CONTROLLED. FOR THE PURPOSE OF THIS MEASUREMENT ON DAMPERS, THE DAMPER POWER CIRCUIT IS THE DEVICE BEING CONTROLLED, PROVIDED THE DAMPERS ARE SELF CLOSING AND HELD OPEN ELECTRICALLY. CONTROL SIGNALS SHALL ALSO BE SENT TO THE BUILDING CONTROL SYSTEM (BAS), BUT THIS DOES NOT SATISFY THE REQUIREMENT FOR SUPERVISED FIRE ALARM CONTROL OF THE DEVICES.
J. PROVIDE FIRE ALARM SYSTEM CONNECTION TO SECURITY LOCK SYSTEMS TO UNLOCK EGRESS DOORS UNDER ALARM CONDITIONS.

General Conditions

1. **Planning, Design, and Implementation Process**
   The multidisciplinary project team should be assembled as early as possible in the design process. The multidisciplinary team should include administrators, clinicians, infection preventionists, architects and other design professionals, facility managers, safety officers, security managers, users of equipment, and support staff relevant to the areas affected by the project as well as those with knowledge of the organization's functional goal for the project. Inclusion of patient advocates/consumers, A/E consultants, and construction specialists should be considered. FGI 2018 APPENDIX A1.2-1.2

2. **Responsibility**
   The customer shall be solely responsible, at their expense for preparation of site. Philips required specifications and any required MEP, construction and structural alterations shall be incorporated into customer's design and construction documents. Compliance with all safety, electrical, and building design codes relevant to the build out of the clinical area for Philips equipment and its installation is the customer's responsibility. Sufficiency of such plans and specifications, specifically including, but not limited to the accuracy of the dimensions described therein, shall be the sole responsibility of the customer. The customer shall advise Philips of conditions at or near the site, which could adversely affect the function of the equipment and/or carrying out of the delivery and installation work. This shall ensure that such conditions are corrected and that the site is fully prepared and available to Philips before the installation work is due to begin.

3. **Permits**
   Customer shall obtain all permits and licenses required by federal, state/provincial or local authorities in connection with the construction, installation and operation of the products and shall bear any expense in obtaining same or in complying with any related rules, regulations, ordinances and statutes.

4. **Radiation Protection**
   The customer or their contractor, at their own expense, shall obtain the service of a licensed radiation physicist to specify radiation protection and testing.

5. **Asbestos and Other Toxic Substances**
   Philips assumes that there is no hazardous material contained in project site. The customer is responsible for the removal of any materials, including but not limited to asbestos, deemed hazardous by local authorities, the EPA, OSHA, or any other authority having jurisdiction over the work. If such materials are discovered at any time that the work is proceeding, the work will immediately cease, the owner will be notified, and the work will again proceed after the owner has removed all of the hazardous material from the job site.

6. **Labor**
   In the event local labor conditions make it impossible or undesirable to use Philips' regular employees for such installation and connection, such work shall be performed by laborers supplied by the customer, or by an independent contractor chosen by the customer at the customer's expense, and in such case, Philips agrees to furnish adequate engineering supervision for proper completion of the installation.

7. **Schedule**
   The customer or general contractor shall provide Philips with a project/construction schedule with milestones to assist in the coordination of delivery of Philips supplied products and primary equipment.

8. **Extended Installation or Turnkey Work by Philips**
   Any room preparation requirements for Philips equipment indicated on these drawings is the responsibility of the customer. If an extended installation or turnkey contract exists between Philips and the customer for room preparation, then additional work required for the equipment will not be represented on these drawings. Some of the responsibilities of the customer as depicted in these drawings may be assumed by Philips. In the event of a conflict between the work described in the turnkey contract work scope and these drawings, the turnkey contract work scope shall govern.

9. **Infection Control and Interim Life Safety Measure**
   Compliance with all Infection Control and Interim Life Safety Measures shall be the sole responsibility of the customer. The customer shall provide all means and methods necessary for compliance with Infection Control (IC) and Interim Life Safety Measures (ILSM) in connection with the construction and installation/operation of the products shown herein and shall bear any expenses related to same.

Minimum Site Preparation Requirements

A smooth efficient installation is vital to Philips and their customers. Understanding what the minimum site preparation requirements are will help achieve this goal. The following list clearly defines the requirements which must be fulfilled by the customer before the delivery and installation of equipment can begin.

1. Walls to be painted or covered, baseboards installed, floors to be tiled and/or covered, ceiling shall have grid tiles and luminaires installed and operational.

2. Doors and windows, especially radiation protection barriers, installed and finished with locksets operational.

3. All electrical convenience outlets, raceways, wireways, auxiliary fittings, knockouts, cable connectors, terminal and power distribution blocks, cable openings, chase nipples, junction boxes and pull boxes installed and operational.

4. A private supply mains branch circuit with overcurrent protective circuit breaker and manual operable circuit disconnect means shall be present and operational. Definition of "Private supply" means an end-leave of the hospital distribution system after the last overcurrent protective disconnect means from which all equipment included in the Azurion ground domain is powered. Note that only equipment included in the Azurion certification and equipment with which the Azurion has a compatibility statement are allowed to be inside the Azurion ground domain. All other electrical equipment is not allowed to have a functional connection to the Azurion system and shall have no direct galvanic connection to prevent ground loops. 3rd party equipment that does not have a function connection with the Azurion system, but that is intended to be used inside the same patient area as the Azurion System shall be grounded to the PCB inside the ERB with a ground bonding of <= 200 mOhm for plugable equipment.

5. Philips does not allow 3rd party equipment inside our cabinets.

6. 120V convenience outlets operational.

7. All support structure correctly installed. All channels, pipes, beams and/or other supporting devices should be level, parallel, and free of lateral or longitudinal movements.

8. All contractor supplied cables pulled and terminated.

9. A dust-free environment in and around the procedure room.

10. All HVAC (heating, ventilating and air conditioning) installed and operational as per specifications.

11. Architectural features such as computer floor, wood floor, casework, bulkheads, installed and finished. When technical cabinets are installed in a closet with doors, it is suggested that the customer install a temperature alarm in the event of an air conditional failure.

12. All plumbing installed and finished.

13. Philips does not install or connect developing tanks, automatic processors or associated equipment, built in illuminators, cassette pass boxes, loading benches and cabinets, lead protective screens, panels or lead glass window and frame. This is to be done by the customer/contractor.

14. Clear door openings for moving equipment into the building must be 42" (1067mm) W x 82" (2083mm) H min. 48" (1219mm) W x 82" (2083mm) H rec., Or larger contingent on an 8'-0" (2438mm) corridor width.

15. Countertop is 30" (765mm) for seated height and 36" (915mm) for standing height.

Note
Once Philips has moved equipment into the suite and started the installation, the contractor shall schedule his work around the Philips installation team on site. It is suggested that a telephone be provided in the room to receive telephone calls. This would alleviate facility staff from answering calls for Philips personnel.

Remote Service Diagnostics
Medical imaging equipment to be installed by Philips Medical is equipped with a service diagnostic feature which allows for remote and on site service diagnostics. To establish this feature, a RJ45 type ethernet 10/100/1000 Mbit network connector must be installed as shown on plan. Access to customer's network via their remote access server is needed for Remote Service Network (RSN) connectivity. All cost with this feature are the responsibility of the customer.

HVAC Requirement for General Equipment Locations

Operation	
Temperature	59°F (15°C) to 86°F (30°C)
Temperature gradient	Max. 1°F / Minute (0.5°C / Minute)
Humidity (non-condensing) Humidity shall be stable within 10%	20% to 80%
Exam Room	*6142 BTU/hr
Equipment Room	*22179 BTU/hr
Control Room	*1945 BTU/hr

***Average heat emission during clinical use**
Data applicable for basic system:
Large monitor + 4 x small monitor in Monitor Ceiling Suspension
1 workstation + 2 x small monitor in Control Room

Add 1194 BTU/hr for additional large monitor
Add 273 BTU/hr for additional small monitor
Add 1024 BTU/hr for additional workstation
See AL sheet for additional heat load in case of UPS

Equipment's designed airflow is from front/side to back. Please design the air handling in the rack cabinet equipment area accordingly.

Heating, ventilation, and air conditioning requirements must maintain temperature at 59°F (15°C) to 86°F (30°C) as well as a non-condensing relative humidity at 20-80% with 10% maximum variation. These temperature and humidity levels must be maintained in all (3) rooms (equipment, examination and control rooms).

(22.0)

Electrical Requirements
Mains 40E Cabinet

Maximum Rated Power:	100kW
Supply Configuration:	3 phase, equally sized insulated power conductors and an insulated equipment grounding conductor. Insulated grounding conductor shall have the same or larger size than line conductors. Line wires shall be no smaller than 6 AWG, 90°C or higher temperature rating. The conductor size is dependant on the upstream circuit breaker rating: Minimum 4 AWG for 80A circuit breaker rating.
Nominal Line Voltage:	480 VAC, 60 Hz
Branch Power Requirement:	100 kVA (System only; verify UPS power requirements)
Circuit Breaker:	3 phase, Type D 80A with long-time delay

(20.1)

Remote Control of Room Lighting

The control of customer lighting must incorporate an electrical isolation system such as demonstrated on Sheet ED3. Lighting scheme is the responsibility of the customer.

Exact location to be coordinated by Customer and local Philips service.

Planning Issues and Considerations

⚠1 Due to door location and swing, servicing will create a safety hazard due to position of rack MA/ME.

⚠2 Verify quantity and designation of Live/Reference slaving monitors with local Philips Service.

⚠3 Structural Engineer to verify adequate space on sides of equipment cabinets for seismic anchoring.

General Notes

* Architect to coordinate with end users/technicians to determine final placement of control desk components prior to installation in order to avoid rework. Architect to coordinate with Philips Project Manager to reflect final placement on Philips drawings.
* Field to verify all existing Philips and/or third party equipment will not affect the functionality of the system and its components.

THIS SHEET IS PART OF THE DOCUMENT SET LISTED ON SHEET C1 AND SHOULD NOT BE SEPARATED.

Equipment Support Information

1. General
The customer shall be solely responsible, at its expense, for preparation of the site, including any required structural alterations. The site preparation shall be in accordance with this plan and specifications, the architectural/construction drawings and in compliance with all safety and building codes. The customer shall be solely responsible for obtaining all construction permits from jurisdictional authority.

2. Equipment Anchorage
Philips provides, with this plan and specifications, information relative to equipment size, weight, shape, anchoring hole locations and forces which may be exerted on anchoring fasteners. The customer shall be solely responsible, through the engineer of record for the building, to provide on the architectural/construction drawings, information regarding the approved method of equipment anchoring to floors, wall and/or ceiling of the building. Any anchorage test required by local authority shall be the customer's responsibility. Stud type anchor bolts should not be specified as they hinder equipment removal for service. Consult with Philips service prior to specifying anchor methods. Philips equipment must be electrically isolated from anchorage.

3. Floor Loading and Surface
Philips provides, with this plan and specifications, information relative to size, weight and shape of floor mounted equipment. The customer shall be solely responsible, through the engineer of record for the building, to provide on the architectural/construction drawings confirmation of the structural adequacy of the floor upon which the equipment will be placed. Any load test required by local authority, shall be the customer's responsibility.
The floor surface upon which Philips equipment is to be placed/anchored shall be flat and level to within $\frac{1}{16}$" (2mm) over a length of 39" (1m).

4. Ceiling Support Apparatus
a. Philips provides, with this plan and specifications, information relative to size, weight and shape of ceiling supported equipment. The customer shall be solely responsible, through the engineer of record for the building, to provide on the architectural/construction drawings, information regarding the approved method of structural support apparatus, fasteners and anchorage to which Philips will attach equipment. Any anchorage and/or load test required by local authority shall be the customer's responsibility. Philips equipment must be electrically isolated from anchorage.

b. Contractor to clearly mark Philips equipment longitudinal centerline on bottom of each structural support.

c. The structural support apparatus surface to which Philips equipment is to be attached, shall have horizontal equipment attachment surfaces parallel, square and level to within .236" (6mm) per entire span.

d. Any drilling and/or tapping of holes required to attach Philips equipment to the structural support apparatus shall be the responsibility of the customer.

e. Fasteners/anchors (i.e., bolts, spring nuts, lock and flat washers) and strip closures shall be provided by the customer.

5. Lighting
Luminaires shall be placed in such a position that they are not obscured by equipment or its movement, nor shall they interfere with Philips ceiling rails and equipment movement or otherwise adversely affect the equipment. Such luminaire locations shall be the sole responsibility of the customer.

6. Ceiling Obstructions
There shall be no obstructions that project below the finished ceiling in the area covered by ceiling suspended equipment travel.

7. Seismic Anchorage (For Seismic Zones Only)
All seismic anchorage hardware, including brackets, backing plates, bolts, etc., shall be supplied and installed by the customer/contractor unless otherwise specified within the support legend on this sheet. Installation of electronic cabinets to meet seismic anchorage requirements must be accomplished using flush mounted expansion type anchor/bolt systems to facilitate the removal of a cabinet for maintenance. Do not use threaded rod/adhesive anchor systems. Consult with Philips regarding any anchor system issues. Philips equipment must be electrically isolated from anchorage.

8. Floor Obstructions/ Floor Coverings
There shall be no obstructions on the floor (sliding door tracks, etc.) within the serviceability area of the Philips technical cabinets. Floor must be clear to allow cabinets to be pulled away from the wall for service. Technical equipment room floor shall be commercial grade "VCT" Vinyl Composition Tile or a flooring material of equal hardness and compression resistance.

9. Safety Factors
Ceiling loads as mentioned in the PRD are worst case loads and excluding safety factors. Proper safety factors need to be applied by Design Professional/Engineer of Record.

10. Stiffness Requirements of Ceiling
Horizontal Stiffness: preferred 10,000,000 Newton/meter - 57.1 klb/in, minimal 6,000,000 Newton/meter - 34.2 klb/in
Vertical Stiffness: preferred 10,000,000 Newton/meter - 57.1 klb/in, minimal 6,000,000 Newton/meter - 34.2 klb/in
Rotation Stiffness: minimal 20,000,000 Newtonmeter/Rad - 177,014 (klb in)/Rad

For Clea Stand (1160 kg or 11600 N): the maximum allowed deflection of the ceiling and/or floor construction is 1.93 mm.
For Poly G Stand (1085 kg or 10850 N): the maximum allowed deflection of the ceiling construction is 1.80 mm.
For Poly G Stand (873 kg or 8730 N): the maximum allowed deflection of the floor construction is 1.46 mm.
For Larc Stand (835 kg or 8350 N): the maximum allowed deflection of the ceiling construction is 1.39 mm.
For FlexArm (FlexArm weight is 1250 kg and ceiling stiffness is 6,000,000 Newton/meter): Max allowed deflection of ceiling structure is 2.1mm.
For FlexMove Clea Stand (1860 kg or 18600 N): the maximum allowed deflection of the ceiling construction is 3.10 mm.

Equipment Support Information

11. Requirements for External Vibration
The maximum allowed external vibration level of floors and ceilings, to which the equipment is mounted that will not adversely affect the image quality, is specified in terms of RMS velocity levels in 1/3-octave or terts bands, as follows:

Center frequency [Hz]	1	1.25	1.6	2	2.5	3.15	4	5	6.3	8
Terts band value [µm/s] (RMS)	50.8	50.8	50.8	50.8	63.5	80.01	101.6	127	160	203.2
Center frequency [Hz]	10	12.5	16	20	25	31.5	40	50	63	80
Terts band value [µm/s] (RMS)	254	317.5	406.4	406.4	406.4	406.4	406.4	406.4	406.4	406.4
Center frequency [Hz]	100	125	160	200						
Terts band value [µm/s] (RMS)	406.4	406.4	406.4	406.4						

Terts Band Specification for External Vibrations

A graphical representation of this specification is given below:

PB1 UNI TV

General Requirements:

1. Philips does not specify the overhead equipment support structure. Unistrut may or may not be used. If Unistrut are used, it is up to Unistrut and the structural engineer for the project to determine which of its products are appropriate for each project.
2. P1000/P1001 Unistrut is specified.

Finished Ceiling Requirements:

1. Finished ceiling must **NOT** be lower than the bottom of the Unistrut in order to prevent damage to the finished ceiling during the installation of clip rails. Finished ceiling height to be mounted 1/4" (6mm) to 1/2" (13mm) above bottom of Unistrut.

Fixing Block Installation Requirements:

1. Nothing shall be attached to the Unistrut with any fastener that protrudes into the Unistrut which would interfere with positioning of the fixing block.
2. Fixing blocks for Philips ceiling rails (Clip rails) are designed to be installed in P1000/P1001Unistrut.
3. The inside of the Unistrut must be clear of obstructions (including paint).

Unistrut Requirements:

1. Unistrut elements must be rigid and comply with the ceiling structure requirements. See SN sheet, line #4 "Ceiling Support Apparatus".
2. Welding Unistrut may warp Unistrut and deteriorate the structural integrity of the Unistrut. Consult the Structural Engineer of Record prior to welding any Unistrut.
3. Third party structural laminar modular array venders the minimum rail fixing block Unistrut length shall be 7 inches.

Emergency Power

Philips does not require equipment to be on emergency power. If the customer deems it necessary for the equipment to be supplied with emergency power, the following specifications must be applied:

The Mains 40E cabinet feeding an Azurion system will have an absolute peak current of <=300A @ 480V. Maximum momentary current <=80A per phase when averaged over a 5-second window. Note that during acquisition, the current harmonics (including sub- and inter-harmonics) up to 1 kHz can be substantial. Account for: 30% for the mains frequency +/- the frame speed, up to 20% for the 5th harmonics, up to 10% for the 7th harmonics.

Maximum differential mode induced disturbance voltage on these wires shall be a <3V peak at all frequencies. Maximum common mode current on these wires shall be less than 3 micro-amp at frequencies between 30-1000MHz to meet EMC regulations.

For systems delivered to site before Jan 2016 or with SIB (system interface box) 4522163320978. When this interface is used a Sub-D capacitive filter adapter with 5.6nF between pins and chassis shall be placed on X14 of the SIB input in the MA-cabinet (e.g. Amphenol FCE17B25AD290).

(22.0)

Electrical Requirement Notes for Systems with Mains 40E Cabinet

Electrical power distribution at the facility shall comply with:

Utilization voltages per ANSI C84.1 - 2006 range A.

Voltage to be supplied is 3 phase, Wye or symmetric Delta 3-line +PE.

Phase conductors to be sized for instantaneous voltage drop per NEC 517.73 and Philips recommendations.

All Philips equipment is grounded via the equipment insulated ground wire. Metal raceway bonding shall be used as a secondary ground fault return path only for the supply mains to the equipment. The raceway system ground and isolated equipment ground shall be bonded together via the ERB terminal jumpers.

The Philips system has a private ground domain per clause 250.96B of the NEC. The raceway from the X-ray breaker (CB) to the Mains 40E Cabinet shall be supplemented by an internal insulated equipment grounding conductor installed in accordance with clause 250.146(D) of the NEC. The Azurion equipment ground domain and the branch circuit ground domain are bonded together in the ERB via a ground bonding jumper.

ANSI / NFPA 70 - National Electrical Code
Article 250 - Grounding
Article 517 - Healthcare Facilities
ANSI / NFPA 99 - Healthcare Facilities

Power Quality Guidelines

1. Power supplied to medical imaging equipment must be separate from power feeds to air conditioning, elevators, outdoor lighting, and other frequently switched or motorized loads. Such loads can cause waveform distortion and voltage fluctuations that can hinder high quality imaging.
2. Equipment that utilizes the facility power system to transmit control signals (especially clock systems) may interfere with medical imaging equipment, thus requiring special filtering.
3. The following devices provide a high impedance, nonlinear voltage source, which may affect image quality: Static UPS systems, Series filters, Power conditioners, and Voltage regulators.
Do not install such devices in the supply mains branch circuit of the Azurion system without consulting Philips installation or service personnel.
4. Line impedance is the combined resistance and inductive reactance of the electrical system and includes the impedance of the power source, the facility distribution system, and all phase conductors between the source and the imaging equipment. The minimum conductor size is based on the total line impedance and NEC requirements. Impedance calculations are to be performed by an electrical engineer.

General Electrical Information

1. General
The customer shall be solely responsible, at its expense, for preparation of the site, including any required electrical alterations. The site preparation shall be in accordance with this plan and specifications, the architectural/construction drawings and in compliance with all safety and electrical codes, the customer shall be solely responsible for obtaining all electrical permits from jurisdictional authority.

2. Materials and Labor
The customer shall be solely responsible, at its expense, to provide and install all electrical ducts, boxes, raceways (conduits, wireways, auxiliary gutters etc.), fittings, bushing, etc., As separately specified herein.

3. Electrical Ducts and Boxes
Electrical ducts and boxes shall be accessible and have removable covers. Floor ducts and boxes shall have watertight covers. Ducts shall be divided into as many as four separate channels by metal dividers, separately specified herein, to separate wiring and/or cables into groups as follows: Group A: Branch circuit equipment supply mains power wires together with the branch circuit isolated equipment bonding wire. Group B: Equipment Secondary Circuit AC supply and associated isolated ground cable/wire harnesses. Group C: Equipment signal wires and cable harnesses plus equipment low-voltage DC supply cable/wire harnesses. Group D: X-Ray high-voltage cables, the use of 90 deg. ells is not acceptable. On ceiling duct and wall duct use 45 deg. bends at all corners. All intersecting points in duct to have cross over tunnels supplied and installed by contractor to maintain separation of cables based on 725.136 for low voltage signaling cables and conductors and 517.80 for communications and signaling cables in health care applications. Secondary circuits of transformer powered communications and signaling systems are not required to be enclosed in raceways unless otherwise specified by Chapter 7 or Chapter 8. All wire harnesses of the Azurion system are required to be run in a raceway (wireway) dedicated to Azurion wire harnesses. No foreign wiring shall be run in the same wireway together with the Azurion wire harnesses. Separation between Group A and other groups is mandatory along the full run of group A wires. Separation between groups B, C, and D is recommended for the first 3 meters behind the equipment cabinets and for the locations where wire-harness over-length is suspended.

4. Raceways (Conduit)
Raceway (Conduit) point - to - point runs shall be as direct as possible. Empty conduit runs used for cables may require pull boxes located along the run. Consult with Philips. A pull wire or cord shall be installed in each conduit run. Best practice to name the physical conduit. All conduits which enter duct prior to their termination point must maintain separation from other cables via use of dividers, cross over tunnels, or conduit supplied and installed by contractor from entrance into duct to exit from duct. Do not use flex conduit unless approved by Philips Service.

5. Conductors
All conductors, separately specified, shall be 90°C stranded copper, rung out and marked.

6. Disconnecting Means
A disconnecting means shall be provided as separately specified.

7. Warning Lights and Door Switches
"X-ray on" warning lights and x-ray termination door switches should be provided at all entrances to x-ray rooms as required by code.

8. Dimmer Switches
X-ray room lights should be provided with dimmer switches.

Electrical Notes

1. The contractor will supply & install all breakers, shunt trip and incoming power to the breakers. The exact location of the breakers and shunt trips will be determined by the architect or contractor.

2. The contractor shall supply & install all pull boxes, raceway runs, stainless steel covers, etc. Conduit/raceways must be free from burrs and sharp edges over its entire length. A Greenlee pull string/measuring tape (part no. 435, or equivalent) must be provided with raceway runs to validate runs are within length restrictions.

3. All pre - terminated, cut to length cables, will be supplied and installed by Philips. All cables and conductors to the equipment supply mains branch circuit breaker shall be supplied and installed by the contractor, subject to local arrangements.

4. Provide and install 50mm diameter chase nipples between adjacent wall boxes.

5. Electrical raceway ducts shall be installed with removable covers. The raceway should be accessible for the entire length. In case of non - accessible floors, walls and ceilings, an adequate number of access hatches should be supplied to enable installation of cabling. Approved raceways may be substituted. All raceways will be designed in a manner that will not allow cables to fall out of the raceway when the covers are removed. In most cases, this will require above - ceiling raceway to be installed with the covers removable from the top. Raceway systems as illustrated on this drawing are based upon length of furnished cables. Any changes in routing of raceway systems could exceed maximum allowable length of furnished cables. Conduits or raceways installed above ceilings must be kept as near as practicable to finished ceilings and still permit accessibility.

6. Raceway sizes shall be verified by the architect, electrical engineer or contractor, in accordance with local or National Electrical Code, whichever govern.

7. Convenience outlets are not shown on the plans. Their number and location are to be specified by the customer/architect.

8. Electrical contractor shall install grounding and bonding conductors at raceway openings within wall boxes as required by national and local electrical codes. Ground bond wires and lugs shall be installed in such a way to prevent the inadvertent contact with the installed Philips equipment to maintain Philips isolated ground scheme and maintain patient safety.

9. Install an insulated stranded ground wire per feeder/conductor size from the Main Disconnect (CB) to the ERB (minimum size 4 AWG) and from the ERB to the Mains 40E Cabinet (minimum size 4 AWG).

10. Philips equipment must be electrically isolated from conduits, raceways, ducts, seismic anchoring, floor anchoring, etc.

General Notes for Testing and Service Purpose: (22.0)

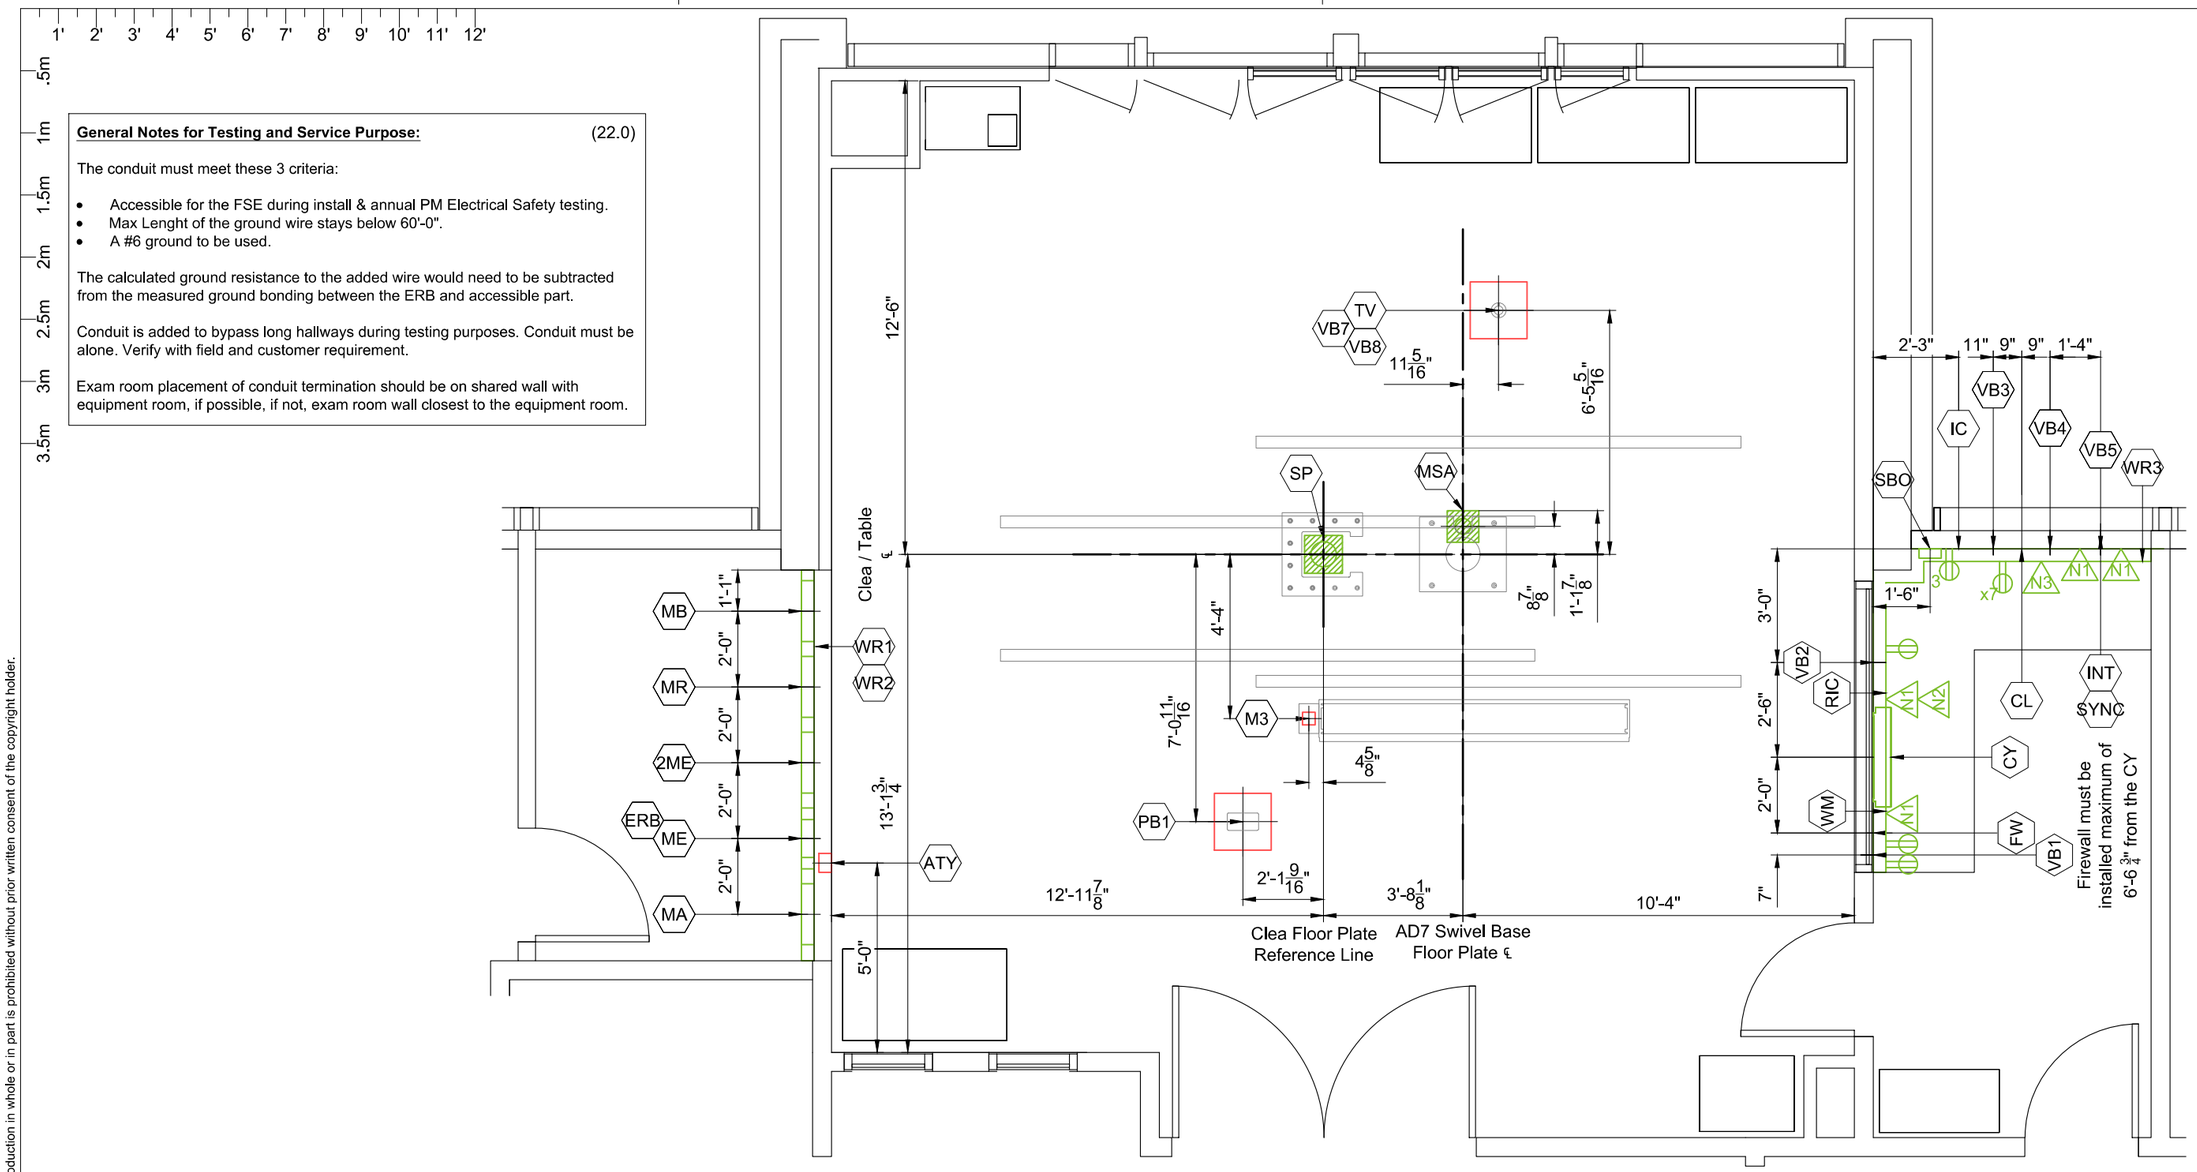
The conduit must meet these 3 criteria:

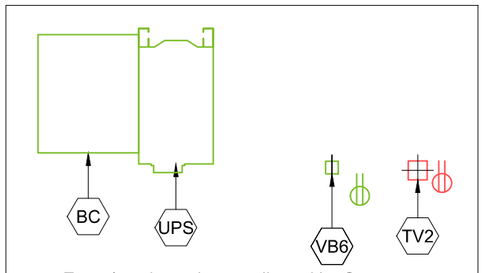
- Accessible for the FSE during install & annual PM Electrical Safety testing.
- Max Lenght of the ground wire stays below 60'-0".
- A #6 ground to be used.

The calculated ground resistance to the added wire would need to be subtracted from the measured ground bonding between the ERB and accessible part.

Conduit is added to bypass long hallways during testing purposes. Conduit must be alone. Verify with field and customer requirement.

Exam room placement of conduit termination should be on shared wall with equipment room, if possible, if not, exam room wall closest to the equipment room.





Exact location to be coordinated by Customer and local Philips service.

Electrical Layout

1/4" = 1'-0"

Required Unistrut Height: 9' - 9 5/16", +3/16" / -0 (2980mm, +4mm / -0)
Unistrut Height measured from top of Clea floor plate to bottom of Unistrut.

Note: The use of 90 degree ells is not acceptable. Use 45 degree bends at all raceway corners. For raceway (conduit) runs, use the minimum bending radius specific to the raceway (conduit) diameter. The use of crossover tunnels at all applicable locations is required. The above mentioned recommendations will help to ensure the integrity of the cables and fiber optic runs.

*** Countertop Height Guide:**
30" (765mm) for standard seated height.
36" (915mm) for standard standing height.
*** Ensure that the wall junction boxes are mounted perpendicular to the floor.**
*** Verify exact ceiling height of Equipment and Control Room Area.**
*** Architect to coordinate with end users/technicians to determine final placement of control desk components prior to installation in order to avoid rework. Architect to coordinate with Philips Project Manager to reflect final placement on Philips drawings.**

Invasive Procedures

This equipment may be used for invasive procedures; therefore, the area to be installed is classified as critical care area per NFPA-99 and NFPA-70 (NEC). These documents specify maximum touch voltages and ground impedance in these areas.

Test performed by GSSNA service require that these specifications are met by the GSSNA equipment. It is the facility's responsibility to ensure that these specifications are met by the wall outlet, facility structure, and other equipment not installed by GSSNA.

The GSSNA specified "Equi-Potential Reference Bar (ERB)" serves as a ground reference for GSSNA equipment. It may also serve as the "Reference Grounding Point" of the room as defined in NFPA 99-3.3.140 for non-Philips Healthcare equipment.

A) Equip-Potential Conductor Bar (ECB)
B) Protective Conductor Bar (PCB)
C) Philips Protective Conductor Bar (PPCB)

* ERB to be placed at a reachable height.
**Verify with Engineer of Record and local codes if additional ground bond wires are required if the electrical continuity requirements for the raceway (wireway) system cannot be met via the conduit hubs.

(Not to scale)

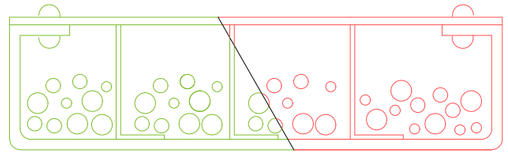
Contractors to discuss raceway plan with Philips Project Manager. Raceways (troughs or ducts) may be separated by metal barriers into four sections. Only required separation if for Group A wires that must be separated from other groups. See sheet EN for more information:

1. Supply Mains conductors and associated PE.
2. Secondary Circuit (Azurion equipment internal single phase 230Vac) conductors and associated PE.
3. High-Voltage wire harness to X-Ray stands.
4. Signal, data and video cables.



5. It is important that all cables are placed in the appropriate raceway (trough), and at no given point do any cables from one division cross cables from another. Trough separation must be continuous from the beginning.
6. Raceway (trough or ducts): steel with steel dividers grounded to building ground.
7. Contractor to provide cable restraints in all troughs.

Philips Collaboration Live

1. Collaboration Live Server - powered by Reacts

The Collaboration Live server is a cloud-hosted enterprise solution that provides contact management, secure connectivity and streaming services for Collaboration Live text, audio and video features. This server is accessed from a separate PC installed in the Azurion control room and remote client end-points over the internet using an industry standard TLS method of connectivity. The server is hosted by IIT (Innovative Imaging Technologies, Montreal, Canada).

2. Connectivity

In order to connect to the Collaboration Live server, the system will need access from within the healthcare facility network to the internet for outbound connections over port 443, and UDP and TCP protocol must be allowed. We recommend whitelisting the following domains:

*.iitreacts.com
*.reacts.com

The minimum bandwidth of 0.5 Mbit/s upload and 0.5 Mbit/s download is required for connectivity. The recommended bandwidth for optimal performance is 1.5 Mbit/s upload and 1.5 Mbit/s download.

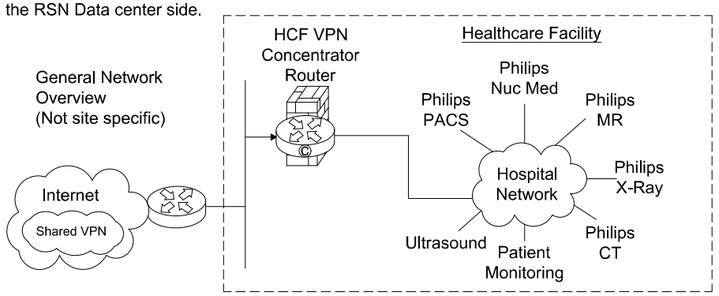
Philips Healthcare Remote Services Network (RSN)

Secure broadband connection required for Philips remote technical support, diagnostics, and applications assistance

Broadband Site-to-Site Connectivity (Preferred)
This connectivity method is designed for customers who prefer a connection from the RSN Data Center to the Health Care Facility (HCF) utilizing their existing VPN equipment.

Connectivity Details:
- A Site-to-Site connection from the RSN data center's Cisco router will be established to the HCF's VPN concentrator.
- The VPN Tunnel will be an IPSEC, 3DES encrypted Tunnel using IKE as standard, but alternative standards are also available, such as AES, MD5, SHA, Security Association lifetime and Encryption Mode.
- Every system that we will be servicing remotely will have a static NAT IP that we configure on the RSN Data center side.

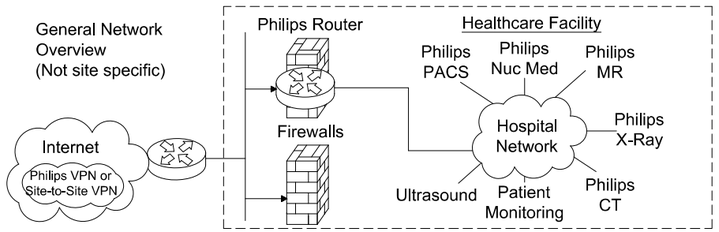


Action Required by Hospital:
- Review and approve connection details.
- Complete appropriate Site Checklist.
- Configure and allow Site-to-Site access prior to setting up connectivity depending on the access criteria that the HCF decides to implement (ex: Source IP filtering, destination IP filtering, NAT assignment, etc.).
- Route traffic from within the hospital network with destination addresses 192.68.48.0/22 to the designed IP provided by Philips.

Broadband Router Installed at Health Care Facility
This connectivity method is designed for customers who have a dedicated high speed connection for Philips equipment.

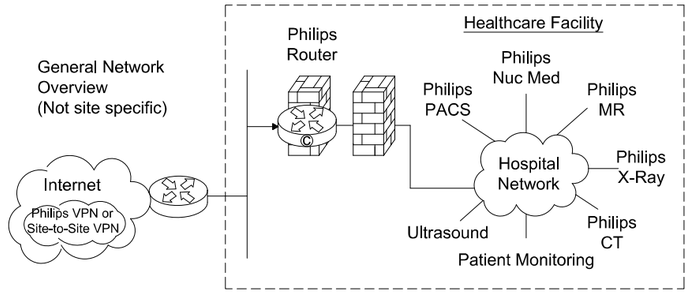
Connectivity Details:
- An RSN Cisco 1711 or 1712 router will be preconfigured and installed at the HCF by Philips in conjunction with the HCF IT representative.
- The VPN Tunnel will be an IPSEC, 3DES encrypted Tunnel using IKE and will be established from the RSN-DC and terminated at the RSN Router on-site.
- One to One NAT is used to limit access to Philips equipment only.
- Router Config and IP auditing is enabled for Customer IT to view via website 24/7.
- Dedicated DSL connections are also supported.

Option 1: Parallel to HCF Firewall Connectivity Method
This connectivity method is designed for customers who prefer a Philips RSN Router installed on site utilizing all the security features provided and managed by Philips.



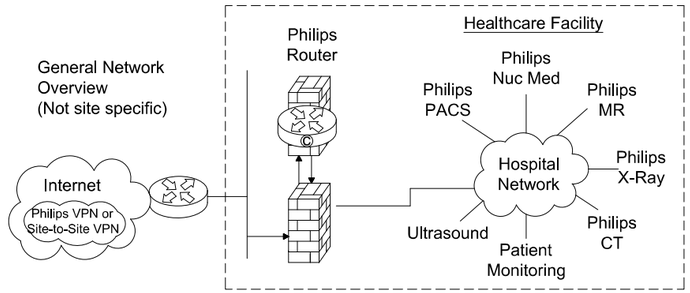
Action Required by Hospital:
- Assign a fixed public IP Address from the ISP to be configured on the Philips router. This is the DOTTED link on the picture connected to the firewall.
- Assign a Back end IP for the Philips router on the Hospital Network.
- Complete appropriate Site Checklist.
- Route traffic from within the hospital network with destination addresses 192.68.48.0/22 to internal Philips router Ethernet interface. This is the DASHED line connected to the firewall.

Option 2: Back End Connected to the HCF Firewall Connectivity Method
This connectivity method is designed for customers who prefer a Philips RSN Router installed on site by setting up an IP-Based policy allowing access thru existing HCF Firewall to Philips equipment.



Action Required by Hospital:
- Assign a fixed public IP Address from the ISP to be configured on the Philips router. This is the DOTTED link on the picture connected to the firewall.
- Assign a Back end IP for the Philips router on the Hospital Network.
- Complete appropriate Site Checklist.
- Route traffic from within the hospital network with destination addresses 192.68.48.0/22 to internal Philips router Ethernet interface. This is the DASHED line connected to the firewall.
- Configure and allow on the firewall on the DASHED line interface access between the IP address allocated by the hospital to the Philips internal Ethernet router interface and the target modality IP address.

Option 3: Router Installed Inside the HCF's DZM
This connectivity method is designed for customers who prefer the RSN Router installed inside and existing, or new DMZ, allowing access to Philips equipment.



Action Required by Hospital:
- Assign a fixed public IP Address from the ISP to be configured on the Philips router. This is the DOTTED link on the picture connected to the firewall.
- Assign a Back end IP for the Philips router on the Hospital Network.
- Complete appropriate Site Checklist.
- Route traffic from within the hospital network with destination addresses 192.68.48.0/22 to internal Philips router Ethernet interface. This is the DASHED line connected to the firewall.
- Configure and allow on the firewall on the DASHED line interface IPSec protocol communication by opening protocol 500, 50, 51, 47 and port 23 + TACACS. Traffic should be between external IP Address located on the Philips router and the RSN Data center IP address 192.68.48/24 and IP address AOSN TACAS.
- Configure and allow on the firewall on the DASHED line interface access between the IP address allocated by the hospital to the Philips internal Ethernet router interface and the target modality IP address.
