There are some discrepancies between the fixture and occupant load summaries in occupancy classifications and occupant loads and fixture requirements do not appear to be per the WA.ST. amendments in chapter 29 of the 2018 IBC. Are the break rooms being used just a break rooms or other uses. Just trying to understand the A-2 & A-3 classifications.

DIVISION 1 GENERAL REQUIREMENTS

1.1 CODES: All construction shall comply with local, state and federal codes and regulations, including all ADA standards.

1.1A PERMITS: Owner shall reimburse contractor for the cost of the building permit and any impact fees. Contractor shall be responsible for all trade permits and business licenses

1.2 **INSURANCE: MUST CONFORM WITH Prologis RISK MANAGEMENT REQUIREMENTS**

1.3 BUILDERS RISK INSURANCE: Owner shall provide builders risk insurance to cover the full value of the work being performed

1.4 JOBSITE CONDITIONS: All contractors must verify existing job conditions prior to bid.

1.5 DOCUMENT CONFLICTS: If there is a conflict in the drawings, or between the written specs and the drawings, the contractor shall be responsible for the more expensive of the options.

1.6 CLOSE-OUT DOCUMENTS: Provide O & M manuals and "as-built" drawings for all architectural, structural, plumbing, electrical, HVAC and fire protection work on two (2) flash drives in pdf format. Provide one (1) hard copy and one electronic copy in pdf format of the stamped permit set of drawings. The value of the close-out documents shall be 10% of the value of the respective work.

1.7 EXISTING STRUCTURE: Nothing may be suspended from the 2x4 or 2x6 sub-purlins at the roof without the structural engineer's written permission except for warehouse lighting fixtures specified below.

1.8 EXISTING CONDITIONS: These finish standards shall be modified to match existing conditions with written approval from the Prologis Project / Property Manager

1.9 FLOOR MAINTENANCE: No vehicles except scissor lifts shall be allowed inside the building during construction without written permission from the owner. All scissor lifts shall have non-marking tires and must be diapered to prevent marking and staining of the concrete floor.

1.10 SUPERVISION: The general contractor shall provide a highly experienced jobsite superintendent, acceptable to the owner, to manage all the work during the course of construction.

1.11 SAFETY: Contractor shall be green flagged in Avetta system prior to beginning any work

1.12 WARRANTIES: Contractor shall provide a one year labor and material warranty from project completion on all work performed.

DIVISION 3 CONCRETE

3.1 PATCHING: Any removal and replacement of the concrete slab shall meet the requirements of the existing slab. Do not overcut corners when cutting the floor in warehouse areas. Use care when removing concrete to avoid damage to adjacent slabs to remain. Backfill and subgrade shall be compacted to 95% of maximum dry density determined in accordance with ASTM D-1557. Dowel the new concrete patch to the existing slab with 1/2" steel dowels, extending a minimum of 8" into slab at 18" o.c., secured with epoxy. Install two (2) #4 rebar horizontally in all plumbing trenches. Use 4,000 p.s.i. (at 28 days) concrete for the pour back. All trench patching in the warehouse area shall have a 1/8 inch radius edge and apply new concrete seal. Prior to pouring concrete, stone the existing sawcut edge with an abrasive brick to approximate a 1/8 inch radius edge. Install vapor barrier if there is existing vapor barrier. Sawcut control joints in new concrete to match existing, and install joint filler to match existing (Metzger McGuire MM80 or equivalent)

3.2 BOLT HOLE AND SLAB CRACK REPAIR: All the top of the floor. Utilize a 2- part epoxy to fill the hole and over-apply to the slab surface. Scrape off the excess material once it is dry. Acceptable material: Metzger McGuire MM-80 semi-rigid 2-part epoxy material, or equal. For crack repair: Repair Procedure: • Chip out spalls to reveal fresh concrete and clean repair area thoroughly. • Repair areas to be at least ½" deep and ½" wide (on either side of control joint), with vertical repair edges, no feathering! • You'll need to fill any deep cracks with sand to provide a backer rod underneath the patching material so it doesn't sink down below grade after you pour the concrete in. Leave ½" – ¾" above sand to be filled with epoxy. Epoxy to be poured so that it's supported directly by firm concrete, with no sand. • Fill area with the 2 part epoxy. Epoxy to be slightly higher than the top of the floor and allow to cure • Sand down the patches so they're smooth and flush with the floor. • When repairing the floor at a warehouse floor joint, it's critical that relief cuts are installed to prevent repair failure.

15.2.9 In buildings with ESFR systems, maintain the necessary clearances to avoid sprinkler head obstructions. Utilize FM Global Property Loss Prevention Data Sheets 2-2 for guidance.

DIVISION 15 HVAC

15.3.1 DESIGN BUILD: Unless engineered HVAC system drawings are included in the bid documents, the HVAC work shall be performed on a design-build basis. The design shall be based upon ASHRAE standards, local code, and weather data. Calculations shall be provided upon owner request. The design-build HVAC contractor shall furnish and install a complete and operative HVAC system to meet all local and state codes.

15.3.2 PLANS: Provide HVAC plans for architect's and owner's review and approval.

15.3.5 UNITS: The HVAC units shall be gas/electric, bottom discharge, as manufactured by Carrier, Trane, Lennox, or York. Units shall be installed on a leveled, manufactured curb. All rooftop equipment shall be seismically fastened to the structure. Side discharge units may not be used. Commercial grade heat pumps by Carrier (model 50TCQ), or Trane (model WCD) may only be used in the Las Vegas or Phoenix markets. When heat pumps are used, they must be installed with auxiliary strip heaters and single point wiring kits. Furnish and install economizers on all units larger than five tons and whenever required by the energy code. For Denver and Salt Lake City areas, provide hail guards on rooftop units

15.3.6 UNIT LOCATIONS: HVAC and evaporative cooler units (when used) shall be located on roof, adjacent to a glulam beam or girder, at or near a structural column, set back from building edge to hide them from sight. Framing for roof penetrations and supports for all roof-top equipment must be reviewed, approved, and stamped by a structural engineer.

15.3.7 EVAPORATIVE COOLER: Evaporative coolers when specified as a customer upgrade shall provide a minimum of four air changes per hour U.O.N. The coolers shall be United Metal Products "Slimline" units or approved equals. Provide adequate relief venting to allow all doors within the tenant space to close properly. The cooler plenums shall be located midway between fire sprinkler lines and fire sprinkler heads in buildings with ESFR systems. The plenums, water supply lines and drain lines shall not encroach into the building's clear space U.O.N.

15.3.8 CURBS/SLEEPERS: All mechanical units (HVAC units, evaporative coolers, and relief vents) shall be located on roof and shall be installed with a self-flashing, leveled, factory curb. Furnish and install 4 inch leg cant strips around all curbs. Absolutely no wood or metal sleepers may be used without owner's written permission.

15.3.9 CONTROLS: The HVAC system shall be connected to a 7-day digital programmable thermostat. All thermostats shall be mounted at 48" A.F.F. and shall have an automatic change-over feature. All thermostats that are not digital are to be converted to a digital programmable thermostat during Make Ready and Tenant Improvement projects. If freeze protection only is installed in the warehouse, the thermostat control should be mounted on the on the inside of the unit at the roof top level.

15.3.10 EXHAUST FANS: Furnish and install an exhaust fan in each toilet room and shower room (if applicable). Install a supply air grille or a transfer grille from the toilet, shower, or break room ceiling to the adjacent conditioned space. In multi-fixture restrooms, fans shall be rated at 150 CFM minimum.

15.3.11 DUCTING: All vertical ducting shall be galvanized sprial, insulated with 1-1/2" wrap and vapor barrier. Horizontal runs may be galvanized spiral or duct board. Any exposed duct in a conditioned warehouse area must be galvanized spiral sheet metal. Final connections to the registers shall be made with a minimum 5' soft flex duct for sound attenuation, and a maximum of 8' in length., All plenums shall be fabricated from insulated galvanized sheet metal of appropriate gauge for low pressure use. Plenums shall extend from the unit to the level of the horizontal branches. No ducting or plenum drops may be installed over warehouse space, unless approved by owner. If the project is a remodel of an existing system, all abandoned ducting shall be removed.

15.3.12 FITTINGS: All wye branch fittings shall have volume dampers with locking quadrant in main and branch ducts. The dampers shall be tagged for easy recognition.

15.3.13 GRILLES: All conditioned areas shall have a supply register and a ducted return register. Transfer grills are not permitted in the office area.

Prologis LED Lighting Specification – Americas

This LED Lighting Specification sets product, install, and procurement guidance for all LED lighting work in the Prologis Americas portfolio. Prologis has selected Acuity Brands to be the sole manufacturer of **LED lighting in the portfolio. All LED lighting spend will need to be directed through Acuity's National Account team.**

Acuity Brands (Lithonia Lighting)	**National Account Pricing Reference Code 901-18-10355**

Specific process flow charts outlining the procurement process and correct contact for each category (New Development, TI, Make Ready, Essentials) are attached as exhibits to this document.

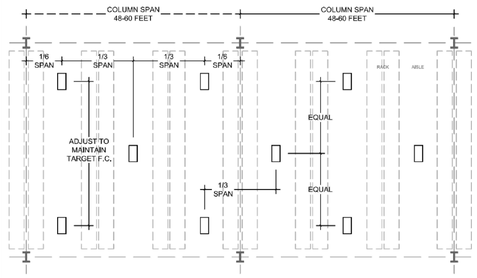
LIGHTING SYSTEM DESIGN, PERFORMANCE AND INSTALLATION REQUIREMENTS

General Requirements: The following general requirements apply to all Prologis lighting projects:

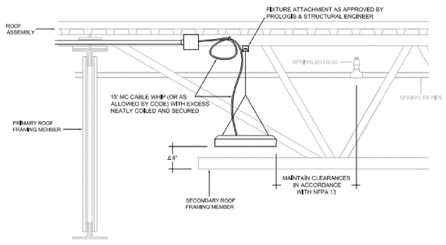
1. All work should be permitted and performed in accordance with local codes.
2. Photometric illumination studies are required for all projects. Reflectance values of walls, floors and ceilings should be set based on the space being lit, utilizing photos, site observation, etc.
3. Local, regional or tenant-driven specifications must be approved or directed by Prologis.
4. Branch wiring #2 and smaller shall be copper.
5. Conduit and cable shall run parallel to or at 90° to building lines.
6. Overhead conduits to be EMT. Alternate types for special conditions to be approved by Prologis.
7. Junction boxes shall be labeled with source panel and circuits contained.
8. Conduits above the roof deck (under the insulation) or within or below the slab are not allowed.

Warehouse Specifications:

A. Minimum Illumination: Open warehouse areas - 25 FC average, 12.5 FC minimum (30" AFF). Racked aisles - 15 FC average, 7.5 FC minimum (30" AFF).
B. Uniformity Ratio: Maximum to minimum of 4:1, average to minimum of 2:1.
C. Design Considerations: Fixtures shall be evenly spaced across the floor plan. Lighting designer shall have the flexibility to shift perimeter light rows off of the typical spacing for the project to minimize dark corner conditions and better illuminate the "Speed Bays" (the first column bay in from the dock wall). When available, racking plans should be used to develop a quality, cost-efficient lighting design. When racking plans are not available, and a new lighting layout is feasible, layouts based on diamond fixture arrangements illuminate open floor plans well and remain flexible for future racking (by requiring fewer fixtures to be added and avoiding instances where fixtures fall directly above racking).



D. Fixture Mounting: Fixtures shall hang 0-6" above the bottom chord of the secondary roof framing members (above the Clear Height) to maximize warehouse volume. Please refer to the fixture mounting detail below. Luminaires shall be installed with MC Cable whips containing #12 AWG conductors, 15' in length or as allowed by code. If allowed locally, a building-wide modular wiring system (RELOC, MWS, etc.) may be used. Fixtures cannot be attached to the roof deck without approval from Prologis and the structural engineer.



E. Controls: Local code will drive the level of controls required. At a minimum, luminaires should be provided with integral occupancy sensors (and daylight sensors when skylights are present) for local, non-networked control. All sensor and control types shall be selected by the design professional.

Office/Non-Warehouse Specifications:

A. Minimum Illumination:
1. Office: 35 FC average (30" AFF)
2. Conference rooms: 40 FC average (30" AFF)
3. Corridors / circulation: 25 FC average (30" AFF)
4. Restrooms, cafeteria, break areas: 30 FC average (32" AFF)

B. Uniformity Ratio: Maximum to minimum of 3:1, average to minimum of 2:1
C. Fixture Application: Illumination for interior office suites should be provided with 2x2, 2x4, recessed downlights and linear fixtures as required to meet the design intent. No less than two fixtures per private office, one light fixture near each exterior exit door to provide 24-hour lighting, plus emergency and egress lighting per code.
D. Controls: Local code will drive the level of controls required. At a minimum, non-networked occupancy controls should be provided. All sensor and control types shall be selected by the design professional. Care should be taken to ensure the specific sensor matches the use of the space, occupancy type, spatial and environmental factors, and local code.

Exterior Lighting Specifications:

A. Minimum Illumination:
1. Trailer parking and truck courts: 0.5 FC average (at grade)
2. Auto parking: 1 FC average (at grade)
3. Main building entry and exits: 5 FC average (at grade)
4. Pedestrian walkways: 2 FC average (at grade)
5. General traffic circulation: 1 FC average (at grade)

B. Uniformity Ratio: Average to minimum of 4:1
C. Fixture Application: Exterior lighting projects shall comply with all applicable codes and requirements. Illumination shall be provided first by wall packs, then by pole-mounted luminaires as a last resort, to meet the design intent. Wall packs shall be provided at exterior man doors and at truck dock areas. Pole lights shall be 30' and 40' tall in car and truck traffic areas, respectively (or as required by local code), and shall not be installed in traffic-exposed areas. Fixture selections should consider site-specific factors such as backlight, uplight, and glare restrictions (collectively B.U.G.), ambient temperature, susceptibility to corrosion, and presence of roosting birds.
D. Controls: Local code will drive the level of controls required. Exterior lighting shall, at a minimum, be controlled by an astronomic time clock system located near the house electrical panel. Time clock should include an override function so lighting can be forced 'on' during non-programmed hours to assist trouble shooting and replacement.

IMPORTANT!
INSTALLER PLEASE NOTE :
This water cooler has been designed and built to provide water to the user which has not been altered by materials in the cooler waterways. The grounding of electrical equipment such as telephone, computer, etc. to water lines is a common procedure. The grounding may be in the building but may also occur away from the building. This grounding can cause electrical feedback into a water cooler creating an electrolysis which creates a metallic taste or causes an increase in the metal content of the water. This condition is avoidable by installing the cooler using the proper materials as shown below.

NOTICE
This water cooler must be connected to the water supply using a dielectric coupling. The cooler is furnished with a non-metallic strainer which meets this requirement. The drain trap which is provided by the installer should also be plastic to completely isolate the cooler from the building plumbing system.
Bottle filler unit on bracket attached to wall by 6 holes (as shown). Water and electrical will connect through pre-punched hole in basin.
These products are designed to operate on 20 psi to 105 psi supply line pressure. Simultaneous operation of both bubblers on a bi-level unit may not be possible depending on water supply pressure. If simultaneous operation is desired, please ensure a minimum of 65 psi supply.
