---	---

1.0 PROJECT OVERVIEW AND CONDITIONS

1.1 Scope

The project proposes to construct the Kessler Center building for the Puyallup School District, which will include classrooms, meeting rooms, and district staff offices. The site is located at 1501 39th Avenue SW, Puyallup, WA 98373. See the Vicinity map included in Figure 1. In addition, the project proposes storm drainage, sanitary sewer, and water utility improvements together with surfacing and restoration that includes paving, curb and sidewalk, and vegetative improvements in support of the building project.

This report addresses the City of Puyallup site development, storm drainage design and stormwater site plan requirements of PMC Chapter 21.10 and the Washington State Department of Ecology Stormwater Management Manual for Western Washington, as Amended in December 2014 (the Manual).

1.2 Existing Conditions Summary

This project proposes improvements to parcel number 0419043117. The parcel is approximately 18.35 acres and has been previously developed for Puyallup School District. The address for this project is at 1501 39th Avenue SW, Puyallup, WA, 98373. According to Pierce County Assessor-Treasurer, there are 5 buildings (four offices and one warehouse) located on this parcel and they are all proposed to remain. The existing warehouse building was built in 1987; the Central Kitchen or Food Services building addition was built in 1997; the Information Technology Center (ITC) office building, the Transportation Center modular office building and a Student Records modular office building were built in 2007. A warehouse addition was constructed in 2019. See Figure 2 for the site plan, which shows existing conditions.

The existing site is gently sloped. The majority of the site has previously been cleared of all forested vegetation and developed in some manner. The site surfacing consists of buildings, impervious pavements and gravels, and vegetative surfaces.

The project site is located within the City of Puyallup's Pothole Drainage Basin, see Figure 10. The stormwater runoff from the site is generally directed to four onsite subbasins, a north, a south and a southwest subbasin as well as the newly created warehouse addition subbasin. The north subbasin includes surface runoff from the existing ITC, Central Kitchen the original Warehouse buildings, and several paved parking lots. The north basin has existing stormwater quality and quantity facilities (StormFilter[®], flow control manhole/oil pollution control device, and infiltration pond.) The south subbasin includes surface runoff from the existing gravel driver training area. The south subbasin has existing stormwater quality (biofiltration swale) that is located upstream of the stormwater quantity facilities (infiltration pond). The southwest subbasin includes runoff that is tributary to the existing wetland that is generally located on an adjacent offsite parcel. The existing wetland receives associated run on from both 17th Street SW and 39th Avenue E. The new warehouse addition subbasin discharges to the new infiltration trench constructed as a part of the recent warehouse Addition Project.

The majority of the proposed work will take place with the south subbasin, with small portions of the project being located in the north and southwest subbasins. Please see the subbasin exhibit presented as Figure 3.

Please see Table 1 of this report for a summary of existing and proposed surfacing for this project.

1.3 Critical Areas

1.3.1 Flood Zone

The project site is located within an area of minimal flood hazard (0.2% annual change flood hazard), Zone X. Please see Figure 6. This site is located near 89th Avenue Court East, which has documented flooding problems due to the nature of the Black Swamp Pothole subbasin. Pierce County has determined a “reasonably safe flood elevation” for the adjacent wetland to be El. 351.0 (NAVD88). The reasonably safe flood elevation of 351.0 (NAVD88) is below all proposed improvements and will not impact the project.

1.3.2 Wetlands

An existing Category IV wetland has been identified adjacent to and offsite with portions of it extending onsite and located in the southwest portion of the parcel. Please see wetland documents included in Appendix E outlining the wetland assessment and reconnaissance work. The wetland reconnaissance work performed and document prepared by Grette Associates, dated May 2019, states the Category IV wetland located in the southwest portion of the parcel shall have a buffer zone of 50 ft. All proposed project improvements are located outside of the wetland and buffer zone.

1.3.3 Aquifer Recharge and Wellhead Protection Zone

The project lies within an aquifer recharge area and wellhead protection area, as defined by the City of Puyallup’s Aquifer Recharge and Wellhead Protection Areas, see Figure 7. This project does not negatively impact the Aquifer Recharge or Wellhead protection area.

1.3.4 Other Critical Areas

We are not aware of any other critical areas on or near the site.

1.4 Proposed Conditions

The project proposes storm, sanitary sewer, and water utility improvements in support of the Kessler Center Building. The Kessler Center Building will connect into the existing water and proposed new gravity sewer piping. Stormwater runoff from pollution generating impervious surfaces will be collected, conveyed and treated by a bioretention facility and then conveyed to infiltration trenches for disposal. Building roof stormwater runoff will be collected and conveyed directly to infiltration. The proposed project surface coverages are summarized in Table 1 of this report and shown on the surface coverage exhibits in Figures 11 and 12. Please see the proposed site plan Figure 2.

Table 1 – Project Surface Coverages

Existing		
Coverage Description	Square Feet	Acres
<i>Grass / Landscaping</i>	217,914	5.00
<i>Gravel</i>	34,369	0.79
<i>Building</i>	1,188	0.03
<i>Pavement</i>	23,363	0.54
Total Impervious	58,920	1.36
Total Project Area	276,834	6.36

Proposed		
Coverage Description	Square Feet	Acres
<i>Grass / Landscaping</i>	83,265	1.91
<i>Gravel</i>	66,753	1.53
<i>Building</i>	23,482	0.54
<i>Pavement</i>	103,334	2.38
Total Impervious	193,569	4.45
Total Project Area	276,834	6.36

Some work is proposed in the southwest subbasin, and therefore a wetland hydrologic analysis is required and is included with this report. See Appendix D.

The north subbasin work consists only of installing one new driveway access to 17th Street. The new and replaced impervious area is about 2,400 square feet and those figures are not included in Table 1. Approximately 1,200 square feet of this area will be tributary to the north subbasin, and approximately 1,200 square feet will be tributary to the existing storm system in 17th Street. Since both of these areas are less than 2,000 square feet, no minimum requirements are triggered for the new driveway.

2.0 DISCUSSION OF MINIMUM REQUIREMENTS

According to the Manual, the development threshold minimum requirement flow charts (presented as Figure 8 of this report) necessitate that Minimum Requirements 1-10 apply to the new hard surfaces, converted pervious surfaces and the land disturbed. Below is a summary of the Minimum Requirements applicable to this project.

2.1 Minimum Requirement #1 - Prepare a Stormwater Site Plan

According to the City of Puyallup Land Use & Development Requirements, a Preliminary and Final Stormwater Site Plan shall be provided. A Preliminary Stormwater Site Plan has been provided with the previous Preliminary Site Plan permit package. This report is the final Stormwater Site Plan and is submitted to the City during the Final Site Plan permitting process per City requirements to fully satisfy this requirement.

2.2 Minimum Requirement #2 - Construction Stormwater Pollution Prevention

A Construction Stormwater Pollution Prevention Plan (CSWPPP) has been prepared and is included with this permit submittal package under a separate cover.

2.3 Minimum Requirement #3 - Source Control for Pollution

The Puyallup School district will employ source control BMPs on the project site in accordance with Volume IV of the Manual. Construction BMPs are included in the CSWPPP.

2.4 Minimum Requirement #4 - Preservation of Natural Drainage Systems and Outfalls

The majority of the area within the project boundary will continue to infiltrate as it does in the existing condition. A wetland analysis has been performed to ensure wetland function will not be adversely affected by any change in discharge (see Appendix D).

2.5 Minimum Requirement #5 - On-site Stormwater Management

Stormwater will be managed onsite in accordance with City of Puyallup and DOE requirements. Per the flow chart for LID requirements included in Figure 8 of this report, the project will elect to satisfy the LID performance standard through the use of infiltration trenches. Additionally, lawn and landscape areas will be subject to BMP T5.13: Post-Construction Soil Quality and Depth.

2.6 Minimum Requirement #6 - Runoff Treatment

The project proposes the use of a bioretention facility to treat runoff from project surfaces. Calculations for the proposed facility are provided in Appendix C.

2.7 Minimum Requirement #7 - Flow Control

The project proposes full infiltration of project surfaces through infiltration trenches. Calculations for the proposed facility are provided in Appendix B.

2.8 Minimum Requirement #8 - Wetland Protection

Grette Associates performed a wetland reconnaissance for the subject site. The site investigations identified one Category IV wetland located in the southwest portion of the subject property. All proposed development is outside of the 50-foot buffer zone. Wetland reports are included in Appendix E of this report. A wetland analysis has been performed to ensure discharge to the wetland conforms to the requirements of Appendix I-D of the Manual. This analysis is included in Appendix D.

2.9 Minimum Requirement #9 - Operation and Maintenance

An Operations and Maintenance Plan is included with this permit submittal package under a separate cover. The O&M Manual document will need to be located at specific locations where this report will not need to be. Therefore, it is best to keep these documents separate from each other.

2.10 Optional Guidance #1 – Financial Liability

Financial liability will be waived as a part of the Final Site Plan Review.

2.11 Optional Guidance #2 – Off Site Analysis and Mitigation

This project does not discharge stormwater off-site in either the north or south subbasin. An offsite analysis for the southwest subbasin (tributary to the adjacent wetland) is included in Appendix D.

3.0 OFFSITE ANALYSIS

An offsite analysis is not required for this project for the north and south subbasins as all onsite runoff is retained and infiltrated, with the exception of a small amount of disturbed area that will be tributary to the adjacent wetland. A required offsite analysis for the southwest subbasin (tributary to the existing wetland) is included in Appendix D.

3.1 Offsite Analysis Study Area

The project site was originally developed for Puyallup School District as a warehouse storage facility within a residential zone in Puyallup.

3.2 Review of Available Information on the Study Area

A Vicinity Map (see Figure 1), Urban Growth Area map (Figure 9), a City of Puyallup Basin Map (Figure 10), a FEMA Floodplain Map (Figure 6), and an Aquifer Recharge & Wellhead Protection Areas Map (Figure 7) are included at the end of the Report. Based on the referenced information, the site lies within the Pothole Basin (Black Swamp Pothole Subbasin), is within the “X” Flood Zone per FEMA, and contains a wetland located in the southwestern area of the property, (see Appendix E).

This site retains and infiltrates all stormwater runoff onsite, with the exception of a small amount of disturbed area that will be tributary to the adjacent wetland. The project will not adversely affect existing offsite stormwater systems or facilities. In the event of an emergency overflow, the proposed infiltration trench will overflow into the proposed bioretention facility. There is no overflow path off of the project site.

4.0 PERMANENT STORMWATER CONTROL PLAN

The project proposes collection of stormwater runoff using catch basins and then conveying it to the appropriate locations using piping. Stormwater runoff from pollution generating impervious surfaces (pgis), or other non pgis or pervious surfaces that mix with pgis surfaces are conveyed to a new bioretention facility that will provide treatment prior to discharge into a new infiltration trench. Runoff collected from the roof of the Kessler center will bypass the bioretention and be discharged directly to the infiltration trench since the roof is

not a pollution-generating surface. Design calculations for each element of this stormwater management plan are included with this report. Appendix A includes conveyance calculations. Appendix B includes infiltration trench calculations. Appendix C includes bioretention calculations. Figure 4 of this report shows the areas tributary to each of the proposed catch basins and storm facilities.

The infiltration system design is based upon infiltrating into the deeper underlying advance outwash soils. The infiltration rate is 5 inches per hour as recommended by the geotechnical report. The geotechnical report recommended that we embed the system into the advance outwash soils 2' to assure contact with the infiltrateable soils.

5.0 CONSTRUCTION STORMWATER POLLUTION PREVENTION PLAN

A Construction Stormwater Pollution Prevention Plan (CSWPPP) has been prepared and is included with this permit submittal package under a separate cover.

6.0 SPECIAL REPORTS AND STUDIES

A Critical Areas Assessment was performed by Habitat Technologies (Appendix E) and it delineated the wetland and wetland buffer (50 feet). A wetland reconnaissance was performed by Grette Associates in order to confirm the wetland location and buffer width and is provided in Appendix E. The Grette reconnaissance confirms the Habitat Technologies report.

A geotechnical investigation of the project area has been completed by Associated Earth Sciences, Inc. (AESI) and summarized in their geotechnical report dated June 17, 2019 (bound separate from this Stormwater Site Plan). However, additional explorations have been completed for the purposes of determining infiltration rates in the vicinity of the proposed infiltration facilities. These explorations are described in the December 18, 2019 Subsurface Exploration, Infiltration Testing and Design Infiltration Rate Determination Report from AESI (also bound separately).

7.0 OTHER PERMITS

This project also requires a SEPA permit. This project proposes to disturb more than 1 acre of land, which means a Construction Stormwater General Permit from Washington State Department of Ecology is required. A building permit is required.

8.0 OPERATION AND MAINTENANCE MANUAL

An Operations and Maintenance Plan is included with this permit submittal package under a separate cover. The O&M Manual document will need to be located at specific locations where this report will not need to be. Therefore, it is best to keep these documents separate from each other.

9.0 DECLARATION OF COVENANT FOR PRIVATELY MAINTAINED FLOW CONTROL AND TREATMENT FACILITIES

The project will provide a declaration of covenant for privately maintained flow control and treatment facilities.

10.0 DECLARATION OF COVENANT FOR PRIVATELY MAINTAINED ON-SITE STORMWATER MANAGEMENT BMPS

The project will provide a declaration of covenant for privately maintained on-site stormwater management BMPs.

MAP PANELS

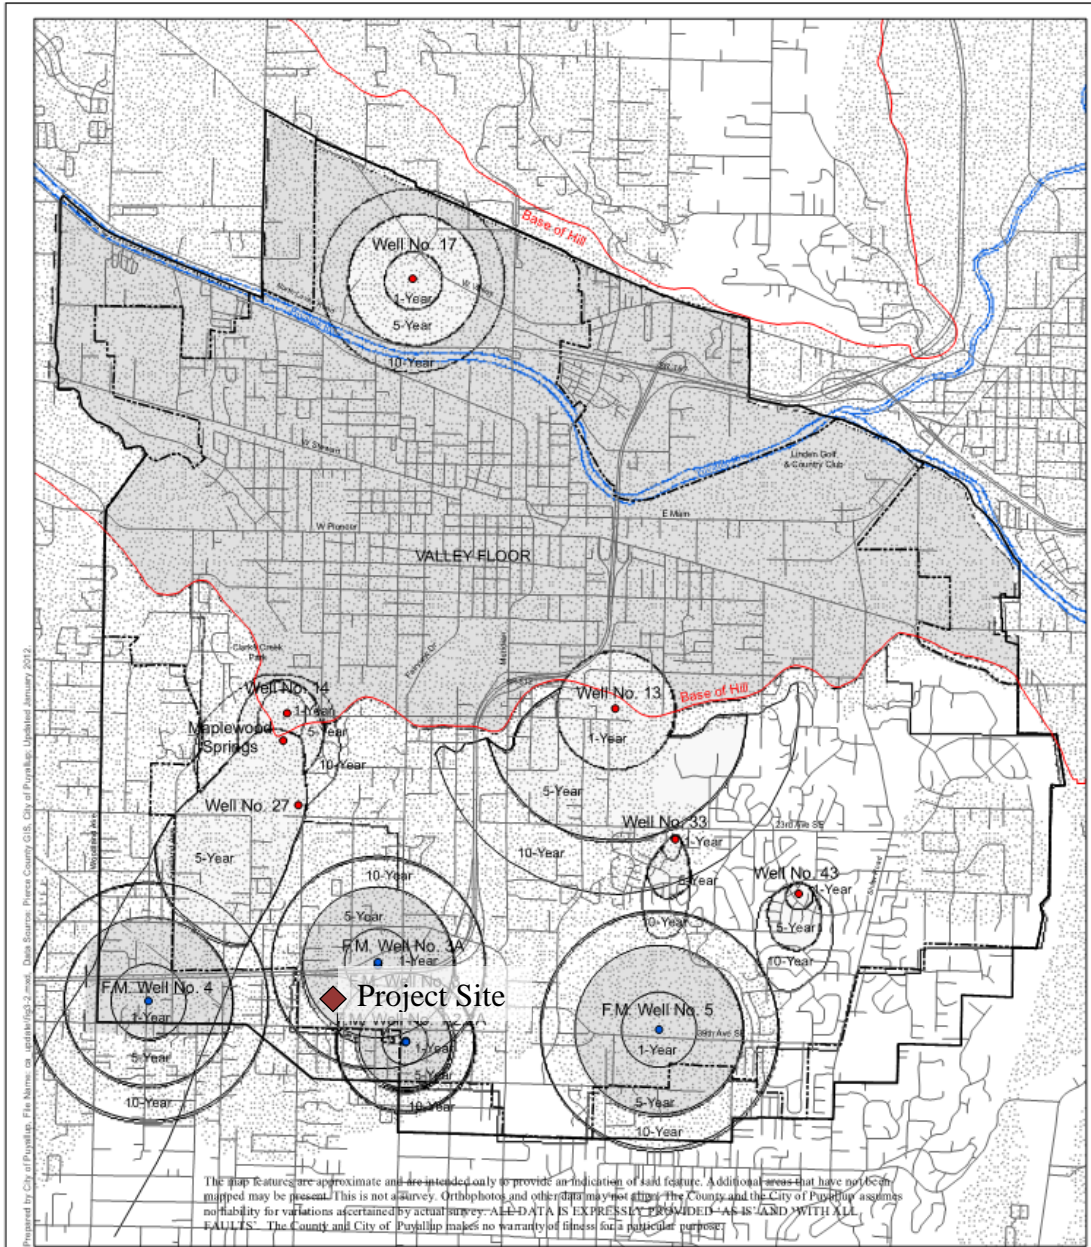

- Digital Data Available
- No Digital Data Available
- Unmapped

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The base map shown complies with FEMA's base map accuracy standards.

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 6/26/2018 at 12:59:58 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: base map imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

Figure 7 – Aquifer Recharge & Wellhead Protection Map

The map features are approximate and are intended only to provide an indication of said feature. Additional areas that have not been mapped may be present. This is not a survey. Orthophotos and other data may not align. The County and the City of Puyallup assumes no liability for variations ascertained by actual survey. ALL DATA IS EXPRESSLY PROVIDED AS IS AND WITH ALL FAULTS. The County and City of Puyallup makes no warranty of fitness for a particular purpose.

APPENDIX B – Infiltration Trench Calculations

The modeled infiltration trench is designed with a 5-foot width by 10-foot height and includes two 30-inch perforated pipes (stacked vertically). This over-sized trench section is used due to the large depth to the infiltrative layer. Flow control basin areas can be seen in Figure 4.

Note that the porosity for layer 2 is determined from the weighted average of a value of 0.4 for the soil material and a value of 1.0 for the pipe space in that layer.

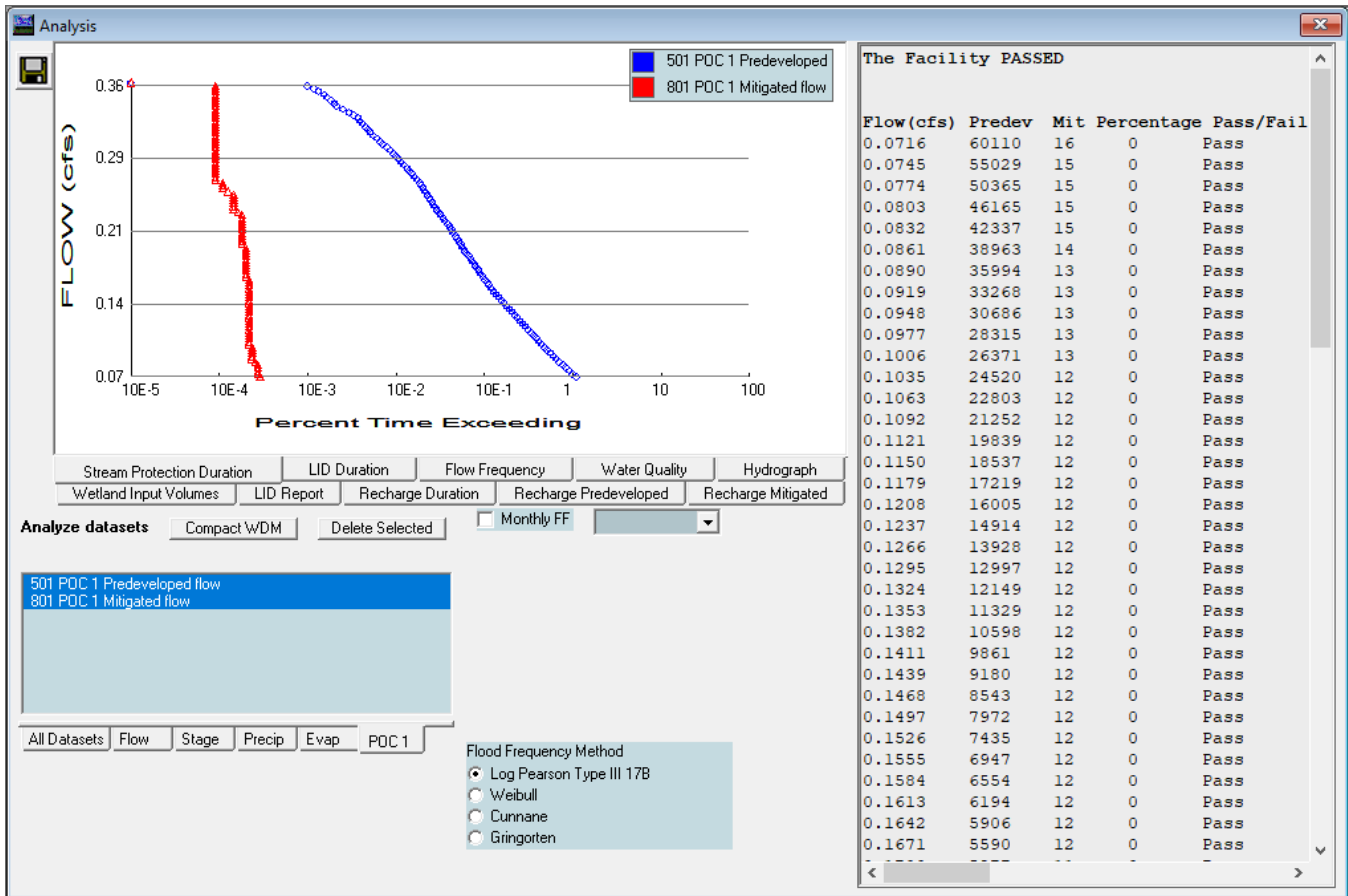

$$\text{Cross sectional area} = 5\text{ft} \times 7\text{ft} = 35\text{sf}$$

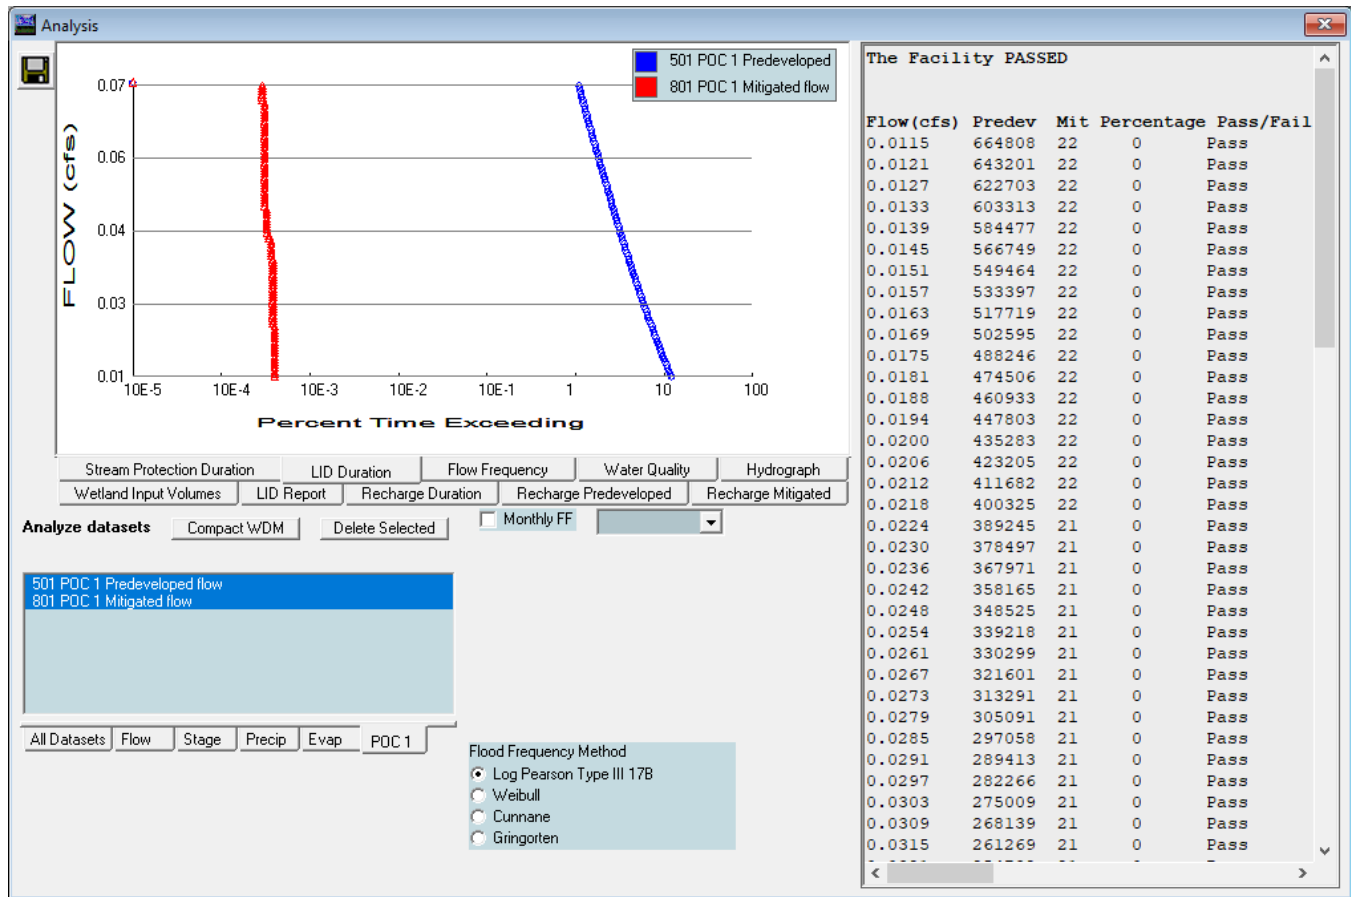

$$\text{Area of pipe} = 2 \times \frac{\pi}{4} (2.5\text{ft})^2 = 9.817\text{sf}$$

$$\text{Area of gravel} = 35\text{sf} - 9.817\text{sf} = 25.183\text{sf}$$

$$\text{Porosity} = \frac{25.183\text{sf} \times 0.4 + 9.817\text{sf} \times 1.0}{35\text{sf}} = 0.57$$

Results:

**WVHM2012
PROJECT REPORT**

Project Name: Infiltration Trench
Site Name: PSD Support Campus
Site Address:
City :
Report Date: 3/26/2020
Gage : 42 IN EAST
Data Start : 10/01/1901
Data End : 09/30/2059
Precip Scale: 1.00
Version Date: 2019/09/13
Version : 4.2.17

Low Flow Threshold for POC 1 : 50 Percent of the 2 Year

High Flow Threshold for POC 1: 50 year

PREDEVELOPED LAND USE

Name : Basin 1
 Bypass: No

GroundWater: No

<u>Pervious Land Use</u>	<u>acre</u>
C, Forest, Flat	5.95
Pervious Total	5.95
<u>Impervious Land Use</u>	<u>acre</u>
Impervious Total	0
Basin Total	5.95

Element Flows To:		
Surface	Interflow	Groundwater

MITIGATED LAND USE

Name : Basin 1
 Bypass: No

GroundWater: No

<u>Pervious Land Use</u>	<u>acre</u>
C, Pasture, Flat	1.6
Pervious Total	1.6
<u>Impervious Land Use</u>	<u>acre</u>
PARKING FLAT	4.35
Impervious Total	4.35
Basin Total	5.95

Element Flows To:		
Surface	Interflow	Groundwater
Gravel Trench Bed 1	Gravel Trench Bed 1	

Name : Gravel Trench Bed 1
 Bottom Length: 952.00 ft.
 Bottom Width: 5.00 ft.

Trench bottom slope 1: 0.001 To 1
 Trench Left side slope 0: 0.001 To 1
 Trench right side slope 2: 0.001 To 1
 Material thickness of first layer: 2
 Pour Space of material for first layer: 0.4
 Material thickness of second layer: 7
 Pour Space of material for second layer: 0.57
 Material thickness of third layer: 1
 Pour Space of material for third layer: 0.4
 Infiltration On
 Infiltration rate: 5
 Infiltration safety factor: 1
 Total Volume Infiltrated (ac-ft.): 2177.479
 Total Volume Through Riser (ac-ft.): 0.163
 Total Volume Through Facility (ac-ft.): 2177.642
 Percent Infiltrated: 99.99
 Total Precip Applied to Facility: 0
 Total Evap From Facility: 0
Discharge Structure
 Riser Height: 10 ft.
 Riser Diameter: 100 in.

Element Flows To:
 Outlet 1 Outlet 2

The development has an increase in flow durations from 1/2 Predeveloped 2 year flow to the 2 year flow or more than a 10% increase from the 2 year to the 50 year flow.
The development has an increase in flow durations for more than 50% of the flows for the range of the duration analysis.

Water Quality BMP Flow and Volume for POC #1
On-line facility volume: 0.1405 acre-feet
On-line facility target flow: 0.1719 cfs.
Adjusted for 15 min: 0.1719 cfs.
Off-line facility target flow: 0.0991 cfs.
Adjusted for 15 min: 0.0991 cfs.

APPENDIX D – Wetland Analysis

Figure 5 shows a map of the basin areas used for this analysis.

Predeveloped Conditions:

Basin 1 Predeveloped

Subbasin Name: Basin 1

Flows To : Surface Interflow Groundwater

Area in Basin Show Only Selected

Available Pervious	Acres	Available Impervious	Acres
<input checked="" type="checkbox"/> C, Pasture, Mod	5.91		

Mitigated Conditions:

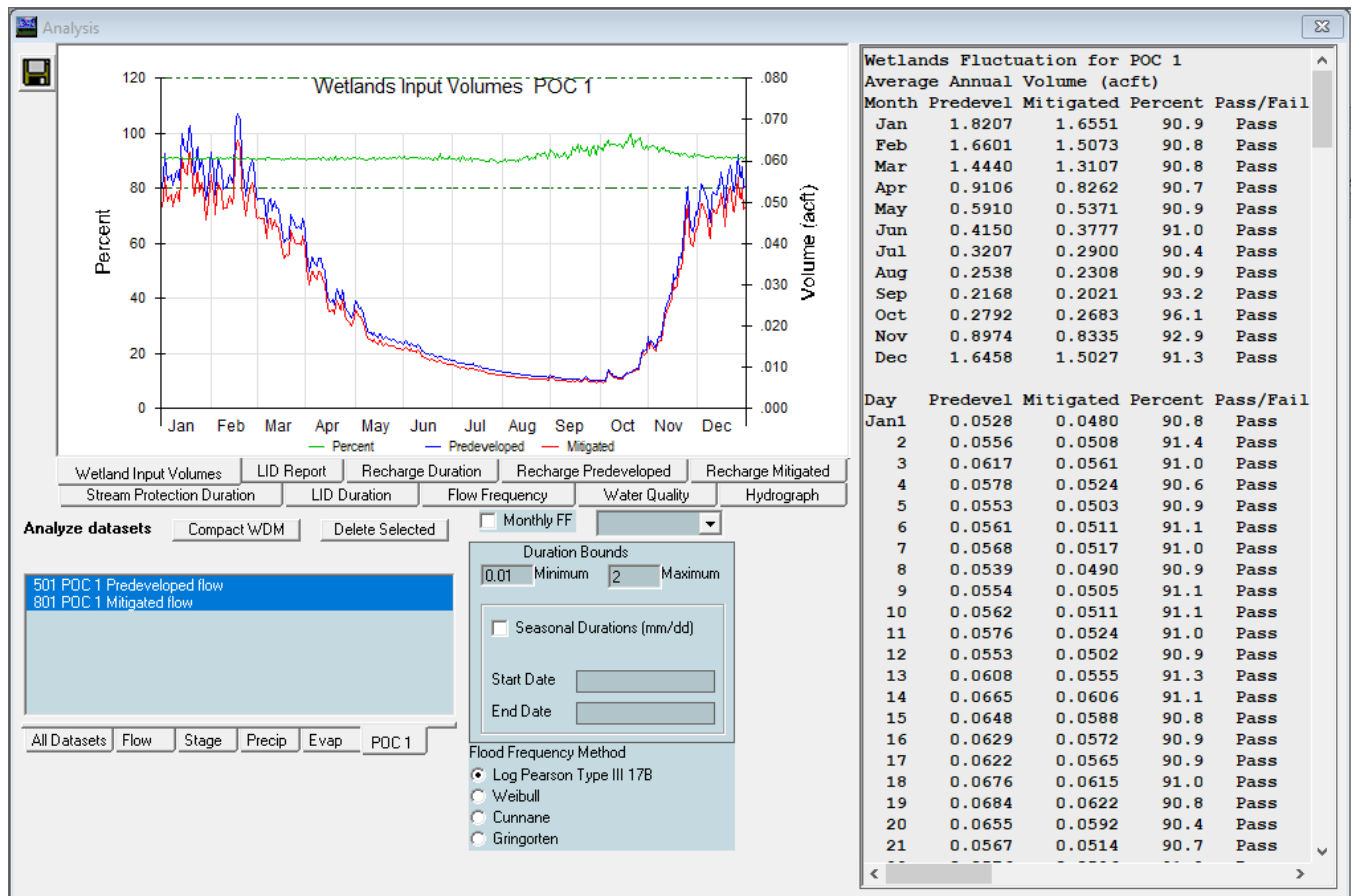

Basin 1 Mitigated

Subbasin Name: Basin 1 Designate as Bypass for POC:

Flows To : Surface Interflow Groundwater

Area in Basin Show Only Selected

Available Pervious	Acres	Available Impervious	Acres
<input checked="" type="checkbox"/> C, Pasture, Mod	5.28	<input checked="" type="checkbox"/> ROOF TOPS/FLAT	.07

**WVHM2012
PROJECT REPORT**

Project Name: Wetland Analysis
Site Name: Kessler Center
Site Address:
City :
Report Date: 12/17/2019
Gage : 42 IN EAST
Data Start : 10/01/1901
Data End : 09/30/2059
Precip Scale: 1.00
Version Date: 2019/09/13
Version : 4.2.17

Low Flow Threshold for POC 1 : 50 Percent of the 2 Year

High Flow Threshold for POC 1: 50 year

PREDEVELOPED LAND USE

Name : Basin 1
 Bypass: No

GroundWater: No

<u>Pervious Land Use</u>	<u>acre</u>
C, Pasture, Mod	5.91

Pervious Total	5.91
----------------	------

<u>Impervious Land Use</u>	<u>acre</u>
----------------------------	-------------

Impervious Total	0
------------------	---

Basin Total	5.91
-------------	------

Element Flows To:		
Surface	Interflow	Groundwater

MITIGATED LAND USE

Name : Basin 1
 Bypass: No

GroundWater: No

<u>Pervious Land Use</u>	<u>acre</u>
C, Pasture, Mod	5.28

Pervious Total	5.28
----------------	------

<u>Impervious Land Use</u>	<u>acre</u>
ROOF TOPS FLAT	0.07

Impervious Total	0.07
------------------	------

Basin Total	5.35
-------------	------

Element Flows To:		
Surface	Interflow	Groundwater

1 INTRODUCTION

Grette Associates, LLC is under contract with the Puyallup School District to conduct a verification of a wetland located at the corner of 39th Ave SW and 17th Street SW in Puyallup, WA (Figure 1). The project site is within Section 04, Township 19N, and Range 04E, W.M. The purpose of this report is to verify the boundaries and ratings of the existing wetland and to document all critical areas within 300 feet of the project site in conformance with critical areas regulations under Puyallup Municipal Code (PMC) Chapters 21.06.530 and 21.06.950.

Figure 1. Vicinity map (project site area in red)

2 FEATURE SUMMARY

A Grette Associates biologist visited the subject property on April 17, 2019 to verify the boundaries and rating of the existing wetland near the project site. Grette Associates staff also inspected the surrounding 300 feet to identify and rate wetlands that may be present outside of the area of the project site. Wetland A was originally delineated and rated in 2017 by Habitat Technologies. Wetland A was originally rated as a Category IV wetland. Grette Associates rated Wetland A as a Category IV wetland based on the requirements in PMC 21.06.910. A summary of the critical areas identified during the site assessment is provided below in Table 1. A critical areas map is provided in Appendix A.

Table 1. Natural water feature identification summary

Feature	Approximate Size	Cowardin Class ²	Hydrology Modifier	HGM Class	Wetland Category ¹	Buffer Width ²
A	34,500 sq. ft.	PFO/EM	Seasonally Flooded and Saturated	Depressional	IV	50

¹ Wetlands were rated according to PMC 21.06.910

² Buffers widths are based on PMC 21.06.930

Figure 2. Category IV Wetland (green) with 50-foot buffer (red)

3 BACKGROUND

3.1 Existing Conditions

Wetland A is situated in an undeveloped area that straddles Pierce County Tax Parcel Nos 0419043091 and 0419043117. Approximately 300 feet to the northeast of Wetland A is the Puyallup School District Technology Support Center. The topography of the assessed area is generally flat and upland vegetation is dominated by large patches of Himalayan blackberry (*Rubus armeniacus*). Wetland A is located in a closed depression that has existing vegetation classes with both forest and emergent species. Historical satellite photos indicate that portions of the site have been disturbed and manipulated in the past. Manipulations to the upland areas include historic residential development, mowing, and development of adjacent properties.

3.2 Local Critical Areas Inventory

The City of Puyallup's official Critical Areas Map was queried to determine if any wetlands are identified on or within 300 feet of the project site (City of Puyallup 2019). City maps indicate a field-verified wetland in the approximate location of Wetland A.

Additionally, Pierce County's Public GIS database was queried to determine if any potential wetlands are identified within 300 feet of the project site (Pierce County 2019). According to Pierce County's Public GIS, the project site is within an area designated as a potential wetland area. Potential wetland areas are based on a combination of hydric, hydrology, and wetland themes.

3.3 National Wetlands Inventory

The U.S. Fish and Wildlife Service's National Wetlands Inventory (NWI) was queried to determine if previously-identified wetlands are present on or within 300 feet of the subject property (USFWS 2019). According to the NWI Interactive Online Mapper, an unnamed stream approximately 700 feet to the east of the project site is designated as a seasonally flooded riverine system (Appendix B). No other wetlands are identified by the NWI on or near the subject property.

3.4 Sensitive Wildlife and Plants

The Washington Department of Fish and Wildlife's (WDFW) Priority Habitats and Species (PHS) database on-line mapper was queried to determine if state or federally listed fish or wildlife species occur on or near the subject property (WDFW 2019a). According to the PHS database, no priority species or habitats are mapped on or within 300 feet of the subject property (Appendix B).

WDFW's SalmonScope was queried to identify any streams and determine if state or federally listed fish or wildlife species occur on or near the subject property (WDFW 2019b). According to SalmonScope, the unnamed stream approximately 700 feet to the east of the project site does not have any documentation of fish utilizing the stream.

The WDNR Natural Heritage Information System was queried to determine if the subject property occurs in a location reported to contain high quality natural heritage wetland occurrences or occurrences of natural heritage features commonly associated with wetlands. According to WDNR data dated March, 18 2019, there are no records of rare plants or high-quality native ecosystems occurring on or in the vicinity of the Site.

3.5 WDNR Stream Mapping

The WDNR Forest Practice Application Mapping Tool was queried to identify any streams mapped by WDNR in the vicinity of the project site (WDNR 2019). According to WDNR, the nearest stream to the subject property is an unnamed stream approximately 700 feet to the east. WDNR has designated the stream as a Type F stream. Type F streams are known to be used by fish, or meet the physical criteria to be potentially used by fish.

3.6 Soil Information

According to the Natural Resources Conservation Service’s (NRCS) Web Soil Survey (NRCS 2019), the soils within the subject property are Alderwood gravelly sandy loam and Indianola loamy sand (Appendix B). Alderwood gravelly sandy loam soils are not rated by the NRCS as being hydric soils. The NRCS also maps other minor component soils under the Alderwood gravelly sandy loam unit such as Mckenna (5%), Shalcar (3%) and Norma (2%) that are listed as hydric soils. Norma (2%) is the only hydric soil component of the Indianola loamy sand soil.

4 PRECIPITATION ANALYSIS

During the site assessment, the McMillin Reservoir National Weather Station (NWS Station 455224) recorded 0.11 inches of rainfall (NOAA 2019). In the 14 days preceding the site assessment, 2.96 inches of rainfall was recorded at the station (NOAA 2019). The total precipitation recorded at the McMillin Reservoir station from April 1, 2018 through March 31, 2019 (34.86 inches) was approximately 80 percent of the normal rainfall (43.49 inches) that occurs during the same time (NOAA 2019 and NRCS 2019a). Table 3 below presents an analysis of the appropriate NRCS WETS table (NRCS 2019b) for the three months preceding the field investigation.

Table 2. WETS precipitation analysis

Preceding Month	WETS Rainfall Percentile (inches)		Measured Rainfall ¹ (inches)	Conditions ²	Condition Value ³	Month Weight	Value
	30%	70%					
March	3.60	5.44	1.23	Dry	1	3	3
February	2.91	5.16	4.90	Normal	2	2	4
January	4.13	6.82	4.05	Dry	1	1	1
Sum:							8

¹ Observed rainfall for the month (NOAA 2019b)

² Dry conditions are below 30% WETS table value, Normal conditions are between 30% and 70% of the WETS table values, Wet conditions are above 70% of the WETS table value.

³ Dry equals a value of 1, normal equals a value of 2, wet equals a value of 3

Bins are established to evaluate the overall rainfall conditions leading up to the field investigation; drier (sum is 6-9), normal (sum is 10-14), wet (sum is 15-18). A sum of 8 indicates that hydrologic conditions at the site were drier than normal at the time of the site investigation.

5 METHODS

The assessment area was traversed and data were collected to confirm the wetland boundary. Wetland A was assessed according to the procedures described in the U.S. Army Corps of Engineers (USACE) *Federal Wetland Delineation Manual* (1987), and the Corps’ *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region (Version 2.0)* (2010). Guidance from the Corps’ *Regional Supplement* was used to evaluate the site’s conditions

Plants were determined to be more or less associated with wetlands based on their wetland indicator (FAC) status. The percent dominance for each plant strata was determined using the 50-20 Rule, which is the recommended method for selecting dominant species from a plant community in instances where quantitative data are available (USACE 2010). In utilizing this rule, dominants are the most abundant species that individually or collectively accounts for more than 50 percent of the total coverage of vegetation in the stratum plus any other species that, by itself accounts for at least 20 percent of the total.

Additionally, the area within 300 ft of the parcel boundary was inspected either visually or through aerial photograph interpretation to determine if other critical areas are within the assessment area.

5.1 Hydrophytic Vegetation

The U.S. Fish and Wildlife Service (USFWS) and the NWI have established a rating system that has been applied to commonly occurring plant species on the basis of their frequency of occurrence in wetlands (Table 3). Species indicator status expresses the range in which plants may occur in wetlands and non-wetlands (uplands). Under this system, vegetation is considered hydrophytic when there is an indicator status of facultative (FAC), facultative wetland (FACW) or obligate wetland (OBL) (Table 3). The hydrophytic vegetation criterion for wetland determination is met when *more than* 50 percent of the dominant species in the plant community are FAC or wetter. The Corps’ *National Wetland Plant List* (Lichvar 2016) was used to determine vegetation indicator status.

Table 3. Definitions for USFWS plant indicator status

Plant Indicator Status Category	Indicator Status Abbreviation	Definition (Estimated Probability of Occurrence)
Obligate Upland	UPL	Occur rarely (<1 percent) in wetlands, and almost always (>99 percent) in uplands
Facultative Upland	FACU	Occur sometimes (1 percent to <33 percent) in wetlands, but occur more often (>67 percent to 99 percent) in uplands
Facultative	FAC	Similar likelihood (33 percent to 67 percent) of occurring in both wetlands and uplands
Facultative Wetland	FACW	Occur usually in wetlands (>67 percent to 99 percent), but also occur in uplands (1 percent to 33 percent)
Obligate Wetland	OBL	Occur almost always (>99 percent) in wetlands, but rarely occur in uplands (<1 percent)
Not Listed	NL	Not listed due to insufficient information to determine status

5.2 Wetland Hydrology

Evidence of permanent or periodic inundation (water marks, drift lines, drainage patterns), or soil saturation to the surface for 12 consecutive days or more during the growing season meets the hydrology criterion. Oxidized root channels in the top 12 inches and hydrogen sulfide are primary indicators and water-stained leaves and geomorphic position are secondary indicators of wetland hydrology.

5.3 Hydric Soils

Soils that are saturated, flooded, or ponded long enough during the growing season to develop anaerobic conditions in the upper soil horizons are considered hydric soils. Field indicators include histosols, the presence of a histic epipedon, a sulfidic odor, low soil

chroma, and gleying. Soil conditions were compared to the Field Indicators of Hydric Soils detailed in the Corps' *Regional Supplement*.

6 WETLAND VERIFICATION

Grette Associates visited the site on April 17, 2019 to conduct a verification of the previously delineated wetland. The verification was conducted to identify the delineated wetland boundaries and to ensure the areas still meet the wetland criteria defined in the USACE's *Federal Wetland Delineation Manual* (1987) and *Regional Supplement* (Version 2.0) (2010). The boundary verification of the wetland was conducted to identify the current boundary locations and to verify the locations of the required wetland buffer. The verification also was conducted to update the wetland ratings using Ecology's Washington State Wetland Rating System for Western Washington – 2014 Update (Hruby 2014).

The boundary of Wetland A was confirmed to be in the same location as was previously delineated in 2017. Flagging from the previous delineation were located, and they were determined to represent the current wetland boundaries. The wetland is located within a closed depression, and no encroachments or development were observed with the wetland that would have changed its boundaries.

6.1 Wetland A

Wetland A is a Palustrine Forested/Emergent, Seasonally Flooded and Saturated wetland that is approximately 34,500 square feet in size and is situated in a topographic depression with no surface water outlet (Appendix A).

6.1.1 Vegetation

Vegetation within Wetland A largely consists of forested species dominated almost entirely by black cottonwood (*Populus balsamifera*). Emergent species in Wetland A were dominated by reed canarygrass (*Phalaris arundinacea*). Buffer vegetation consisted mainly of Himalayan blackberry.

6.1.2 Hydrology

Wetland A is hydrogeomorphically described as a depressional system and hydrologic support is provided by surface flow and shallow groundwater. Heavy precipitation events can result in periodic sheet flow into the wetland. On the day of investigation, both saturation and a high water table were observed within the wetland. There is no surface water outlet from the wetland.

6.1.3 Hydric Soils

Soils observed within the wetland consisted of a layer of dark gray (10YR 4/1) sandy loam. The upper portion of the soil profile had more organic content and the lower portion had brown redoximorphic features (10YR 4/3). Soils within Wetland A meet the definition of a hydric soil by demonstrating the field indicators of a Depleted Matrix (F3). Of the assessed soils, redox concentrations were observed throughout approximately 40% of the soil matrix.

6.1.4 Wetland Categorization

To determine the categorization of the wetland within the assessment area based on function, the wetland classification guidelines in Ecology’s wetland rating system (Hruby 2014) were used (PMC 21.06.910). Based on this guidance, the wetland was given a score for each of three functions: Water Quality, Hydrology, and Habitat (Table 4). The rating forms used to score the wetlands are included in Appendix C.

Table 4. Wetland rating and categorization summary

Feature	Cowardin Class	HGM Class	Water Quality	Hydrology	Habitat	Total	Category
Wetland A	PFO/EM	Depressional	5	6	4	15	IV

While the wetland provides moderate water quality and hydrology function, due to its geomorphic position within the landscape, Wetland A provides low habitat function. As a result, Wetland A is classified as a Category IV wetland and is subject to a 50-foot buffer according to PMC 21.06.930. This rating is consistent with the rating previously accepted by the City of Puyallup for the 2017 delineation conducted by Habitat Technologies.

6.1.5 Functions and Values

Wetland A likely provides some level of water quality enhancement, hydrology, and habitat functions. This wetland likely filters out sediments and toxins from shallow groundwater, preventing them from entering the surrounding landscape. Additionally, the wetland likely provides some foraging and refuge for small mammals as well as passerine foraging and refuge.

7 DISCUSSION

Grette Associates identified one wetland feature that is located in the general area where the previous Category IV wetland was delineated. Based on topographic constraints and data collected, Grette Associates does not believe that the wetland boundary has significantly changed since the previous wetland delineation. Furthermore, Grette Associates preliminarily rated this feature according to the requirements defined in Chapter 21.06 of the Puyallup Municipal Code (PMC). Based on these requirements, the wetland feature is considered a Category IV wetland. According to PMC 21.06.930, Category IV wetlands with a high intensity land use are subject to a 50-foot buffer (PMC 21.06.930).

8 BIOLOGIST QUALIFICATIONS

8.1 Tom Peterman

Tom Peterman is a Biologist with training in wetland science and ecology restoration. Tom also has professional experience in fisheries, wetland and stream restoration, mitigation monitoring, and fish and wildlife assessments. Tom has earned a graduate degree and a certificate in wetland science and management from the University of Washington. For a list of representative projects, please contact him at Grette Associates.

DISCLAIMER. This report includes information that the Washington Department of Fish and Wildlife (WDFW) maintains in a central computer database. It is not an attempt to provide you with an official agency response as to the impacts of your project on fish and wildlife. This information only documents the location of fish and wildlife resources to the best of our knowledge. It is not a complete inventory and it is important to note that fish and wildlife resources may occur in areas not currently known to WDFW biologists, or in areas for which comprehensive surveys have not been conducted. Site specific surveys are frequently necessary to rule out the presence of priority resources. Locations of fish and wildlife resources are subject to variation caused by disturbance, changes in season and weather, and other factors. WDFW does not recommend using reports more than six months old.

Hydric Soil List - All Components---Pierce County Area, Washington

Hydric Soil List - All Components

This table lists the map unit components and their hydric status in the survey area. This list can help in planning land uses; however, onsite investigation is recommended to determine the hydric soils on a specific site (National Research Council, 1995; Hurt and others, 2002).

The three essential characteristics of wetlands are hydrophytic vegetation, hydric soils, and wetland hydrology (Cowardin and others, 1979; U.S. Army Corps of Engineers, 1987; National Research Council, 1995; Tiner, 1985). Criteria for all of the characteristics must be met for areas to be identified as wetlands. Undrained hydric soils that have natural vegetation should support a dominant population of ecological wetland plant species. Hydric soils that have been converted to other uses should be capable of being restored to wetlands.

Hydric soils are defined by the National Technical Committee for Hydric Soils (NTCHS) as soils that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part (Federal Register, 1994). These soils, under natural conditions, are either saturated or inundated long enough during the growing season to support the growth and reproduction of hydrophytic vegetation.

The NTCHS definition identifies general soil properties that are associated with wetness. In order to determine whether a specific soil is a hydric soil or nonhydric soil, however, more specific information, such as information about the depth and duration of the water table, is needed. Thus, criteria that identify those estimated soil properties unique to hydric soils have been established (Federal Register, 2002). These criteria are used to identify map unit components that normally are associated with wetlands. The criteria used are selected estimated soil properties that are described in "Soil Taxonomy" (Soil Survey Staff, 1999) and "Keys to Soil Taxonomy" (Soil Survey Staff, 2006) and in the "Soil Survey Manual" (Soil Survey Division Staff, 1993).

If soils are wet enough for a long enough period of time to be considered hydric, they should exhibit certain properties that can be easily observed in the field. These visible properties are indicators of hydric soils. The indicators used to make onsite determinations of hydric soils are specified in "Field Indicators of Hydric Soils in the United States" (Hurt and Vasilas, 2006).

Hydric soils are identified by examining and describing the soil to a depth of about 20 inches. This depth may be greater if determination of an appropriate indicator so requires. It is always recommended that soils be excavated and described to the depth necessary for an understanding of the redoximorphic processes. Then, using the completed soil descriptions, soil scientists can compare the soil features required by each indicator and specify which indicators have been matched with the conditions observed in the soil. The soil can be identified as a hydric soil if at least one of the approved indicators is present.

Map units that are dominantly made up of hydric soils may have small areas, or inclusions, of nonhydric soils in the higher positions on the landform, and map units dominantly made up of nonhydric soils may have inclusions of hydric soils in the lower positions on the landform.

The criteria for hydric soils are represented by codes in the table (for example, 2). Definitions for the codes are as follows:

Hydric Soil List - All Components---Pierce County Area, Washington

1. All Histels except for Folistels, and Histosols except for Folists.
2. Soils in Aquic suborders, great groups, or subgroups, Albolls suborder, Historthels great group, Histoturbels great group, Pachic subgroups, or Cumulic subgroups that:
 - A. Based on the range of characteristics for the soil series, will at least in part meet one or more Field Indicators of Hydric Soils in the United States, or
 - B. Show evidence that the soil meets the definition of a hydric soil;
3. Soils that are frequently ponded for long or very long duration during the growing season.
 - A. Based on the range of characteristics for the soil series, will at least in part meet one or more Field Indicators of Hydric Soils in the United States, or
 - B. Show evidence that the soil meets the definition of a hydric soil;
4. Map unit components that are frequently flooded for long duration or very long duration during the growing season that:
 - A. Based on the range of characteristics for the soil series, will at least in part meet one or more Field Indicators of Hydric Soils in the United States, or
 - B. Show evidence that the soil meets the definition of a hydric soil;

Hydric Condition: Food Security Act information regarding the ability to grow a commodity crop without removing woody vegetation or manipulating hydrology.

Wetland Rating System for Western WA: 2014 Update
Rating Form – Effective January 1, 2015

2

Wetland name or number Wetland A

HGM Classification of Wetlands in Western Washington

For questions 1-7, the criteria described must apply to the entire unit being rated.
If the hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1-7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

NO - go to 2

YES - the wetland class is **Tidal Fringe** - go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

NO - **Saltwater Tidal Fringe (Estuarine)**

YES - **Freshwater Tidal Fringe**

*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands. If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.

NO - go to 3

YES - The wetland class is **Flats**

*If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?

The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;

At least 30% of the open water area is deeper than 6.6 ft (2 m).

NO - go to 4

YES - The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?

The wetland is on a slope (*slope can be very gradual*),

The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks,

The water leaves the wetland **without being impounded**.

NO - go to 5

YES - The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?

The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,

The overbank flooding occurs at least once every 2 years.

Wetland name or number Wetland A

NO - go to 6

YES - The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

NO - go to 7

YES - The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

NO - go to 8

YES - The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. **GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT** (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

*If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.*

Wetland name or number Wetland A

DEPRESSIONAL AND FLATS WETLANDS		
Water Quality Functions - Indicators that the site functions to improve water quality		
D 1.0. Does the site have the potential to improve water quality?		
D 1.1. Characteristics of surface water outflows from the wetland: Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet). Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet. Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch.	points = 3 points = 2 points = 1 points = 1	3
D 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions). Yes = 4 No = 0		0
D 1.3. Characteristics and distribution of persistent plants (Emergent, Scrub-shrub, and/or Forested Cowardin classes): Wetland has persistent, ungrazed, plants > 95% of area Wetland has persistent, ungrazed, plants > 1/2 of area Wetland has persistent, ungrazed plants > 1/10 of area Wetland has persistent, ungrazed plants < 1/10 of area	points = 5 points = 3 points = 1 points = 0	3
D 1.4. Characteristics of seasonal ponding or inundation: <i>This is the area that is ponded for at least 2 months. See description in manual.</i> Area seasonally ponded is > 1/2 total area of wetland Area seasonally ponded is > 1/4 total area of wetland Area seasonally ponded is < 1/4 total area of wetland	points = 4 points = 2 points = 0	4
Total for D 1 Add the points in the boxes above		10

Rating of Site Potential If score is: 12-16 = H 6-11 = M 0-5 = L Record the rating on the first page

D 2.0. Does the landscape have the potential to support the water quality function of the site?		
D 2.1. Does the wetland unit receive stormwater discharges?	Yes = 1 No = 0	0
D 2.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?	Yes = 1 No = 0	0
D 2.3. Are there septic systems within 250 ft of the wetland?	Yes = 1 No = 0	0
D 2.4. Are there other sources of pollutants coming into the wetland that are not listed in questions D 2.1-D 2.3? Source _____	Yes = 1 No = 0	0
Total for D 2 Add the points in the boxes above		0

Rating of Landscape Potential If score is: 3 or 4 = H 1 or 2 = M 0 = L Record the rating on the first page

D 3.0. Is the water quality improvement provided by the site valuable to society?		
D 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 303(d) list?	Yes = 1 No = 0	0
D 3.2. Is the wetland in a basin or sub-basin where an aquatic resource is on the 303(d) list?	Yes = 1 No = 0	1
D 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality (answer YES if there is a TMDL for the basin in which the unit is found)?	Yes = 2 No = 0	0
Total for D 3 Add the points in the boxes above		1

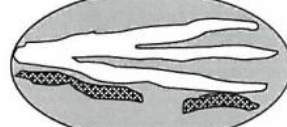

Rating of Value If score is: 2-4 = H 1 = M 0 = L Record the rating on the first page

Wetland name or number Wetland #

DEPRESSIONAL AND FLATS WETLANDS		
Hydrologic Functions - Indicators that the site functions to reduce flooding and stream degradation		
D 4.0. Does the site have the potential to reduce flooding and erosion?		
D 4.1. Characteristics of surface water outflows from the wetland:		
Wetland is a depression or flat depression with no surface water leaving it (no outlet)	points = 4	4
Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet	points = 2	
Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch	points = 1	
Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing	points = 0	
D 4.2. Depth of storage during wet periods: Estimate the height of ponding above the bottom of the outlet. For wetlands with no outlet, measure from the surface of permanent water or if dry, the deepest part.		
Marks of ponding are 3 ft or more above the surface or bottom of outlet	points = 7	3
Marks of ponding between 2 ft to < 3 ft from surface or bottom of outlet	points = 5	
Marks are at least 0.5 ft to < 2 ft from surface or bottom of outlet	points = 3	
The wetland is a "headwater" wetland	points = 3	
Wetland is flat but has small depressions on the surface that trap water	points = 1	
Marks of ponding less than 0.5 ft (6 in)	points = 0	
D 4.3. Contribution of the wetland to storage in the watershed: Estimate the ratio of the area of upstream basin contributing surface water to the wetland to the area of the wetland unit itself.		
The area of the basin is less than 10 times the area of the unit	points = 5	3
The area of the basin is 10 to 100 times the area of the unit	points = 3	
The area of the basin is more than 100 times the area of the unit	points = 0	
Entire wetland is in the Flats class	points = 5	
Total for D 4	Add the points in the boxes above	10
Rating of Site Potential If score is: <u>12-16 = H</u> <input checked="" type="checkbox"/> <u>6-11 = M</u> <input type="checkbox"/> <u>0-5 = L</u> Record the rating on the first page		
D 5.0. Does the landscape have the potential to support hydrologic functions of the site?		
D 5.1. Does the wetland receive stormwater discharges?	Yes = 1 No = 0	0
D 5.2. Is >10% of the area within 150 ft of the wetland in land uses that generate excess runoff?	Yes = 1 No = 0	0
D 5.3. Is more than 25% of the contributing basin of the wetland covered with intensive human land uses (residential at >1 residence/ac, urban, commercial, agriculture, etc.)?	Yes = 1 No = 0	1
Total for D 5	Add the points in the boxes above	1
Rating of Landscape Potential If score is: <u>3 = H</u> <input checked="" type="checkbox"/> <u>1 or 2 = M</u> <input type="checkbox"/> <u>0 = L</u> Record the rating on the first page		
D 6.0. Are the hydrologic functions provided by the site valuable to society?		
D 6.1. The unit is in a landscape that has flooding problems. Choose the description that best matches conditions around the wetland unit being rated. Do not add points. Choose the highest score if more than one condition is met.		
The wetland captures surface water that would otherwise flow down-gradient into areas where flooding has damaged human or natural resources (e.g., houses or salmon redds):		
• Flooding occurs in a sub-basin that is immediately down-gradient of unit.	points = 2	1
• Surface flooding problems are in a sub-basin farther down-gradient.	points = 1	
Flooding from groundwater is an issue in the sub-basin.	points = 1	
The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. Explain why _____	points = 0	
There are no problems with flooding downstream of the wetland.	points = 0	
D 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?		
	Yes = 2 No = 0	0
Total for D 6	Add the points in the boxes above	1
Rating of Value If score is: <u>2-4 = H</u> <input checked="" type="checkbox"/> <u>1 = M</u> <input type="checkbox"/> <u>0 = L</u> Record the rating on the first page		

Wetland Rating System for Western WA: 2014 Update
Rating Form - Effective January 1, 2015

Wetland name or number Wetland A

These questions apply to wetlands of all HGM classes.	
HABITAT FUNCTIONS - Indicators that site functions to provide important habitat	
H 1.0. Does the site have the potential to provide habitat?	
<p>H 1.1. Structure of plant community: <i>Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.</i></p> <p> <input type="checkbox"/> Aquatic bed 4 structures or more: points = 4 <input checked="" type="checkbox"/> Emergent 3 structures: points = 2 <input type="checkbox"/> Scrub-shrub (areas where shrubs have > 30% cover) 2 structures: points = 1 <input checked="" type="checkbox"/> Forested (areas where trees have > 30% cover) 1 structure: points = 0 <i>If the unit has a Forested class, check if:</i> <input checked="" type="checkbox"/> The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon </p>	2
<p>H 1.2. Hydroperiods</p> <p>Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (<i>see text for descriptions of hydroperiods</i>).</p> <p> <input type="checkbox"/> Permanently flooded or inundated 4 or more types present: points = 3 <input checked="" type="checkbox"/> Seasonally flooded or inundated 3 types present: points = 2 <input type="checkbox"/> Occasionally flooded or inundated 2 types present: points = 1 <input checked="" type="checkbox"/> Saturated only 1 type present: points = 0 <input type="checkbox"/> Permanently flowing stream or river in, or adjacent to, the wetland <input type="checkbox"/> Seasonally flowing stream in, or adjacent to, the wetland <input type="checkbox"/> Lake Fringe wetland 2 points <input type="checkbox"/> Freshwater tidal wetland 2 points </p>	1
<p>H 1.3. Richness of plant species</p> <p>Count the number of plant species in the wetland that cover at least 10 ft². <i>Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle</i></p> <p>If you counted: > 19 species points = 2 5 - 19 species points = 1 < 5 species points = 0</p>	1
<p>H 1.4. Interspersion of habitats</p> <p>Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. <i>If you have four or more plant classes or three classes and open water, the rating is always high.</i></p> <div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;">  None = 0 points </div> <div style="text-align: center;">  Low = 1 point </div> <div style="text-align: center;">  Moderate = 2 points </div> </div> <div style="display: flex; justify-content: space-around; align-items: center; margin-top: 20px;"> <div style="text-align: center;">  All three diagrams in this row are HIGH = 3 points </div> <div style="text-align: center;">  </div> <div style="text-align: center;">  </div> </div>	1

Wetland name or number Wetland A

<p>H 1.5. Special habitat features: Check the habitat features that are present in the wetland. <i>The number of checks is the number of points.</i></p> <p><input checked="" type="checkbox"/> Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long).</p> <p><input checked="" type="checkbox"/> Standing snags (dbh > 4 in) within the wetland</p> <p><input type="checkbox"/> Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m)</p> <p><input type="checkbox"/> Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (<i>cut shrubs or trees that have not yet weathered where wood is exposed</i>)</p> <p><input type="checkbox"/> At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (<i>structures for egg-laying by amphibians</i>)</p> <p><input type="checkbox"/> Invasive plants cover less than 25% of the wetland area in every stratum of plants (<i>see H 1.1 for list of strata</i>)</p>		2
Total for H 1	Add the points in the boxes above	7

Rating of Site Potential If score is: 15-18 = H 7-14 = M 0-6 = L Record the rating on the first page

<p>H 2.0. Does the landscape have the potential to support the habitat functions of the site?</p>		
<p>H 2.1. Accessible habitat (include <i>only habitat that directly abuts wetland unit</i>).</p> <p>Calculate: % undisturbed habitat <u> </u> + [(% moderate and low intensity land uses)/2] <u> </u> = <u> </u> %</p> <p>If total accessible habitat is:</p> <p>> 1/3 (33.3%) of 1 km Polygon points = 3</p> <p>20-33% of 1 km Polygon points = 2</p> <p>10-19% of 1 km Polygon points = 1</p> <p>< 10% of 1 km Polygon points = <u>0</u></p>		0
<p>H 2.2. Undisturbed habitat in 1 km Polygon around the wetland.</p> <p>Calculate: % undisturbed habitat <u> </u> + [(% moderate and low intensity land uses)/2] <u> </u> = <u> </u> %</p> <p>Undisturbed habitat > 50% of Polygon points = 3</p> <p>Undisturbed habitat 10-50% and in 1-3 patches points = 2</p> <p>Undisturbed habitat 10-50% and > 3 patches points = <u>1</u></p> <p>Undisturbed habitat < 10% of 1 km Polygon points = 0</p>		1
<p>H 2.3. Land use intensity in 1 km Polygon: If</p> <p>> 50% of 1 km Polygon is high intensity land use points = (- 2)</p> <p>≤ 50% of 1 km Polygon is high intensity points = 0</p>		- 2
Total for H 2	Add the points in the boxes above	- 1

Rating of Landscape Potential If score is: 4-6 = H 1-3 = M < 1 = L Record the rating on the first page

<p>H 3.0. Is the habitat provided by the site valuable to society?</p>		
<p>H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? <i>Choose only the highest score that applies to the wetland being rated.</i></p> <p>Site meets ANY of the following criteria: points = 2</p> <ul style="list-style-type: none"> <input type="checkbox"/> It has 3 or more priority habitats within 100 m (see next page) <input type="checkbox"/> It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) <input type="checkbox"/> It is mapped as a location for an individual WDFW priority species <input type="checkbox"/> It is a Wetland of High Conservation Value as determined by the Department of Natural Resources <input type="checkbox"/> It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan <p>Site has 1 or 2 priority habitats (listed on next page) within 100 m points = 1</p> <p>Site does not meet any of the criteria above points = <u>0</u></p>		0

Rating of Value If score is: 2 = H 1 = M 0 = L Record the rating on the first page

Wetland name or number Wetland A

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp. <http://wdfw.wa.gov/publications/00165/wdfw00165.pdf> or access the list from here: <http://wdfw.wa.gov/conservation/phs/list/>)

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** *This question is independent of the land use between the wetland unit and the priority habitat.*

- **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).
- **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).
- **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

Wetland name or number Wetland A

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type	Category
<i>Check off any criteria that apply to the wetland. Circle the category when the appropriate criteria are met.</i>	
SC 1.0. Estuarine wetlands Does the wetland meet the following criteria for Estuarine wetlands? — The dominant water regime is tidal, — Vegetated, and — With a salinity greater than 0.5 ppt Yes – Go to SC 1.1 <input checked="" type="radio"/> No = Not an estuarine wetland	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? Yes = Category I No - Go to SC 1.2	Cat. I
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? — The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are <i>Spartina</i> , see page 25) — At least ¼ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or unmowed grassland. — The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. Yes = Category I No = Category II	Cat. I Cat. II
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? Yes – Go to SC 2.2 No – Go to SC 2.3 SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? Yes = Category I <input checked="" type="radio"/> No = Not a WHCV SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf Yes – Contact WNHP/WDNR and go to SC 2.4 No = Not a WHCV SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? Yes = Category I No = Not a WHCV	Cat. I
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? <i>Use the key below. If you answer YES you will still need to rate the wetland based on its functions.</i> SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? Yes – Go to SC 3.3 <input checked="" type="radio"/> No – Go to SC 3.2 SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? Yes – Go to SC 3.3 <input checked="" type="radio"/> No = Is not a bog SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? Yes = Is a Category I bog No – Go to SC 3.4 NOTE: If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? Yes = Is a Category I bog No = Is not a bog	Cat. I

Wetland name or number Wetland A

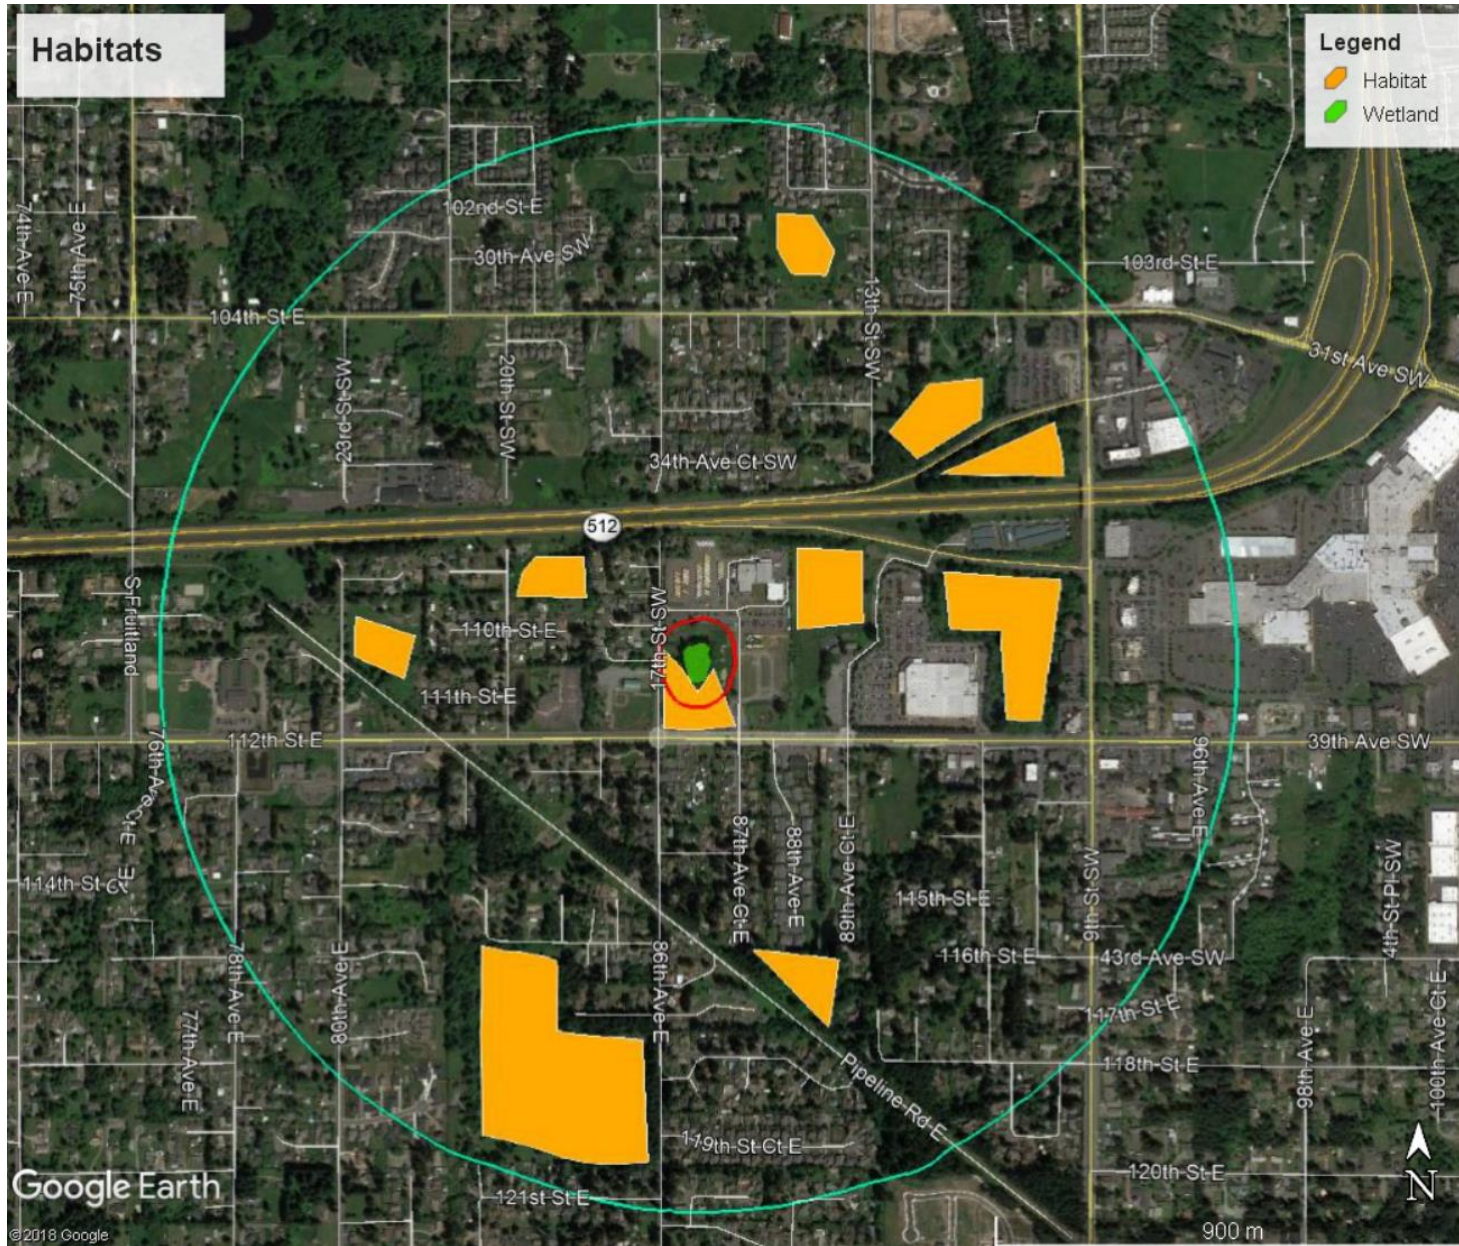

<p>SC 4.0. Forested Wetlands</p> <p>Does the wetland have at least <u>1 contiguous acre</u> of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? <i>If you answer YES you will still need to rate the wetland based on its functions.</i></p> <ul style="list-style-type: none"> — Old-growth forests (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more. — Mature forests (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm). <p style="text-align: right;">Yes = Category I No = Not a forested wetland for this section</p>	<p>Cat. I</p>
<p>SC 5.0. Wetlands in Coastal Lagoons</p> <p>Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?</p> <ul style="list-style-type: none"> — The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks — The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (<i>needs to be measured near the bottom</i>) <p style="text-align: right;">Yes – Go to SC 5.1 No = Not a wetland in a coastal lagoon</p> <p>SC 5.1. Does the wetland meet all of the following three conditions?</p> <ul style="list-style-type: none"> — The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100). — At least ¼ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or unmowed grassland. — The wetland is larger than 1/10 ac (4350 ft²) <p style="text-align: right;">Yes = Category I No = Category II</p>	<p>Cat. I</p> <p>Cat. II</p>
<p>SC 6.0. Interdunal Wetlands</p> <p>Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? <i>If you answer yes you will still need to rate the wetland based on its habitat functions.</i></p> <p>In practical terms that means the following geographic areas:</p> <ul style="list-style-type: none"> — Long Beach Peninsula: Lands west of SR 103 — Grayland-Westport: Lands west of SR 105 — Ocean Shores-Copalis: Lands west of SR 115 and SR 109 <p style="text-align: right;">Yes – Go to SC 6.1 No = not an interdunal wetland for rating</p> <p>SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)? Yes = Category I No – Go to SC 6.2</p> <p>SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger? Yes = Category II No – Go to SC 6.3</p> <p>SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac? Yes = Category III No = Category IV</p>	<p>Cat I</p> <p>Cat. II</p> <p>Cat. III</p> <p>Cat. IV</p>
<p>Category of wetland based on Special Characteristics If you answered No for all types, enter "Not Applicable" on Summary Form</p>

INTRODUCTION

This document details the culmination of activities and onsite evaluations undertaken to complete assessment of potential critical areas - in particular wetlands, streams, and critical habitats - within and immediately adjacent to **Parcel 0419043091 (project site)**. The project site was located at the northeastern corner of the intersection of 112th Street East (39th Avenue SE) and 17th Street SW within the City of Puyallup, Pierce County, Washington (part of Section 04, Township 19 North, Range 04 East, Quarter 33, W.M.) (Figure 1). The evaluation and characterization of onsite and adjacent critical areas is a vital element in land use planning. The goal of this approach is to ensure that present and future proposed planned site development, to include the establishment of protective buffers, does not result in adverse environmental impacts to identified wetlands, streams, critical habitats, their associated buffer, or local water quality.

The assessment and evaluation of critical areas within and immediately adjacent to the project site was completed following the methods and procedures defined in the *Corps of Engineers Wetland Delineation Manual* (1987 Manual) with the 2010 *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region* (2010 Supplement); the *Washington State Wetlands Rating System* (Hruby 2014); the State of Washington Department of Natural Resources (WDNR) Forest Practice Rules (WAC 222-16-030); and the City of Puyallup Chapter 21.

PROJECT SITE DESCRIPTION

The project site was rectangular in shape and approximately 3.9-acres in size. The project site was located within an area of existing residential and increasing commercial development along the 112th Street East Corridor. The project site had undergone prior land use manipulations to include forest harvest, clearing and grading, historic homesite development and land management, the development of adjacent properties, and the development of public roadway/utility corridors. A topographic depression was present in the northeastern portion of the project site.

Legal Description: Section 04 Township 19 Range 04 Quarter 33 BEG 30 FT N & 15 FT E OF SW COR TH N 553.14 FT TH E 315 FT TH S 553.14 FT TH W 315 FT TO BEG EXC POR CYD TO CY OF PUYALLUP PER ETN 4339081 EASE #2326342 OUT OF 3/015 & 3/901 SEG K1899 DL DL PP DC00375917 8/21

Directions to Project Site: From Meridian Avenue southbound turn west on 39th Avenue SW. Continue west of 39th Avenue SW (112th Street East) to 17th Street SW. Turn north onto 17th Street SW - the project site is to the northeast corner of the intersection of 39th Avenue SW and 17th Street SW.

BACKGROUND INFORMATION

NATIONAL WETLAND INVENTORY

The National Wetland Inventory (NWI) mapping completed by the U.S. Fish and Wildlife Service was reviewed as a part of this assessment (Figure 2). This mapping resource did not identify any wetlands or stream within or immediately adjacent to the project site.

STATE OF WASHINGTON PRIORITY HABITATS AND SPECIES

The State of Washington Priority Habitats and Species (PHS) Mapping was reviewed as a part of this assessment (Figure 3). This mapping resource did not identify any priority habitats or species within or immediately adjacent to the project site.

STATE OF WASHINGTON DEPARTMENT OF FISH AND WILDLIFE

The State of Washington Department of Fish and Wildlife (WDFW) mapping was reviewed as a part of this assessment (Figure 4). This mapping resource did not identify any drainage corridors within the project site. This mapping resource generally identified an offsite drainage corridor to the east of the project site. This mapping resource did not identify any salmonid species within the vicinity of the project site.

STATE OF WASHINGTON DEPARTMENT OF NATURAL RESOURCES

The State of Washington Department of Natural Resources (WDNR) mapping was reviewed as a part of this assessment (Figure 5). This mapping resource did not identify any drainage corridors within the project site. This mapping resource generally identified an offsite drainage corridor as noted in the WDFW mapping resource above to the east of the project site. This offsite drainage corridor was identified as a WDNR Type F Water (fish presence).

CITY OF PUYALLUP MAPPING

The City of Puyallup inventory mapping was reviewed as a part of this assessment (Figure 6). This mapping resource identified a wetland within the northeastern portion of the project site. This mapping resource also identified soils which have been defined to potentially support Mazama pocket gophers (*Thomomys mazama*) along the eastern portion of the project site.

SOILS MAPPING

The soil mapping inventory completed by the Soils Conservation Service was reviewed as a part of this assessment (Figure 7). This mapping resource identified the soil throughout the western and central portions of the project site as Alderwood gravelly sandy loam (1B). The Alderwood soil series is defined as moderately well drained; as formed in glacier till; and as listed as to have inclusions of "hydric" soil areas.

2
17066

The eastern portion of the project site was identified to contain Indianola loamy sand (18B). The Indianola soil series is defined as somewhat excessively drained, as formed in sandy glacial outwash, and as not listed as "hydric" soil.

PRIOR ONSITE AND ADJACENT ASSESSMENTS

Over the past several years Habitat Technologies has completed at least three (3) formal wetland delineations for the project site as well as a number of wetland delineations for a variety of adjacent parcels. These prior assessments have identified that an isolated topographic depression was present in the northeastern corner of the project site. In addition, the plant communities throughout the project site had been managed generally through mowing to control the establishment of invasive shrub thickets.

ONSITE ANALYSIS

CRITERIA FOR CRITICAL AREAS IDENTIFICATION

The City of Puyallup defines "critical areas" to include wetlands, fish and wildlife habitat areas, critical aquifer recharge areas, geologically hazardous areas, and frequently flooded areas. The critical areas assessment reported in this document has been limited to address wetlands and fish and wildlife habitat areas.

Wetlands: Wetlands are transitional areas between aquatic and upland habitats. In general terms, wetlands are lands where the extent and duration of saturation with water is the primary factor determining the nature of soil development and the types of plant and animal communities living in the soil and on its surface (Cowardin, et al., 1979). Wetlands are generally defined within land use regulations as "areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" (United States Army Corps of Engineers, 1987). Wetlands exhibit three essential characteristics, all of which must be present for an area to meet the established criteria (United States Army Corps of Engineers, 1987 and United States Army Corps of Engineers, 2010). These essential characteristics are:

- 1. Hydrophytic Vegetation:** The assemblage of macrophytes that occurs in areas where inundation or soil saturation is either permanent or of sufficient frequency and duration to influence plant occurrence. Hydrophytic vegetation is present when the plant community is dominated by species that require or can tolerate prolonged inundation or soil saturation during the growing season.
- 2. Hydric Soil:** A soil that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions

3
17066

in the upper parts. Most hydric soils exhibit characteristic morphologies that result from repeated periods of saturation or inundation. These processes result in distinctive characteristics that persist in the soil during both wet and dry periods.

- 3. Wetland Hydrology:** Permanent or periodic inundation, or surface soil saturation, at least seasonally. Wetland hydrology indicators are used in combination with indicators of hydric soil and hydrophytic vegetation to define the area. Wetland hydrology indications provide evidence that the site has a continuing wetland hydrology regime. Where hydrology has not been altered vegetation and soils provide strong evidence that wetland hydrology is present.

Fish and Wildlife Habitat Areas: The City of Puyallup has defined "fish and wildlife habitat areas" to include those areas necessary for maintaining species in suitable habitats within their natural geographic distribution so that isolated subpopulations are not created as designated by WAC 365-190-080. These areas include:

- (a) Areas with which state or federally designated endangered, threatened, and sensitive species have a primary association;
- (b) Habitats of local importance, including but not limited to areas designated as priority habitat by the Department of Fish and Wildlife;
- (c) Streams and surface waters within the jurisdiction of the state of Washington; and
- (d) Land essential for preserving connections between habitats and open spaces.

STUDY METHODS

Habitat Technologies completed a series of onsite assessments during March and April 2017. In addition, Habitat Technologies has completed similar assessments for parcels located within the general area of the project site over the past several decades. The objective of this evaluation was to define and delineate potential critical areas (wetlands; streams; and fish and wildlife habitats) that may be present within or immediately adjacent to the project area. Onsite activities were completed in accordance with criteria and procedures established in the *Corps of Engineers Wetland Delineation Manual* (1987 Manual) with the 2010 *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region* (2010 Supplement); the Washington State *Wetlands Rating System* (Hruby 2014); the State of Washington Department of Natural Resources (WDNR) Forest Practice Rules (WAC 222-16-030); and the City of Puyallup Chapter 21..

FIELD OBSERVATION

The project site was accessed via an existing driveway connection to 17th Street SW along the western boundary of the project site. This existing driveway at one time provided access for the single-family home (now demolished) and what may have at

one time been a small veterinarian clinic. The majority of the project site appeared to have been historically managed as livestock pasture. However, this use had discontinued in past years and the majority of the project site was now dominated by dense thickets of Himalayan blackberry (*Rubus procera*) that appear regularly mowed as a control measure. The project site was surrounded by previously developed parcels and public roadways. Field data are provided in Appendix A.

- **Soils**

As documented at representative sample plots within the majority of the project site, the soil exhibited a sandy loam to gravelly sandy loam texture and coloration typical of both the Alderwood and Indianola soils. The surface soil within the project site was generally very dark grayish brown to dark grayish brown (10YR 3/2 to 10YR 3/3). The subsoil to a depth of 24 inches was generally dark grayish brown to brown (10YR 3/3 to 10YR 4/3). The majority of the onsite soil appeared to drain moderately well and did not exhibit prominent redoximorphic features.

Within the depression in the northeastern portion of the project site the surface soils exhibited a dark gray coloration (10YR 3/1) and silty loam texture with a high content of decomposing organic materials from onsite vegetation. The subsoil exhibited a dark gray to dark grayish brown coloration (10YR 3/1 to 10YR 4/2) and silty loam texture. The subsoil within this depression exhibited prominent redoximorphic features.

- **Hydrology**

Onsite hydrology appeared to be the result of seasonal stormwater runoff from onsite and adjacent parcels. The majority of the project site appeared to drain moderately well to well following seasonal storm events. In addition, the onsite assessments were completed during a period of generally higher than normal seasonal rainfall.

An isolated depression was identified within the northeastern portion of the project site. This depression was identified to seasonally pond surface water throughout the majority of the wetland area. As noted during prior assessments this depression would remain seasonally ponded/saturated into at least the early portion of the growing season. Prior assessments also did not identify an outlet for this depression and the seasonal ponding did not generally exceed three to four feet at the deepest point.

- **Vegetation**

The project site was dominated by plant communities typically associated with a managed lawn/pasture with areas of remnant retained trees. The majority of the project site exhibited large areas dominated by dense thickets of Himalayan blackberry. Observed species throughout the project site included a few retained Douglas fir (*Pseudotsuga menziesii*), black cottonwood (*Populus trichocarpa*), cherry (*Prunus virginiana*), domestic plum (*Prunus spp.*), hawthorne (*Crataegus monogyna*), locust (*Robinia spp.*), evergreen blackberry (*Rubus laciniatus*), Pacific blackberry (*Rubus*

ursinus), Scot's broom (*Cytisus scoparius*), rose (*Rosa* spp.), Indian plum (*Oemleria cerasiformis*), Pacific red elderberry (*Sambucus racemosa*), English ivy (*Hedera helix*), bracken fern (*Pteridium aquilium*), nettle (*Urtica dioica*), Canadian thistle (*Cirsium arvensis*), bull thistle (*Cirsium vulgare*), smooth cats ear (*Hypochaeris glabra*), hairy cats ear (*Hypochaeris radicata*), sheep sorrel (*Rumex acetosella*), dandelion (*Taraxacum officinale*), geranium (*Geranium* spp.), daisy (*Bellis* spp.), clover (*Trifolium* spp.), wheatgrass (*Agropyron* spp.), bentgrass (*Agrostis tenuis* and *Agrostis alba*), orchard grass (*Dactylis glomerata*), fescue (*Festuca* spp.), vernal grass (*Anthoxanthum odoratum*), bluegrass (*Poa* spp.), and buttercup (*Ranunculus repens*). This plant community was identified as non-hydrophytic in character (i.e. typical of uplands).

Onsite management actions have included the routine mowing of blackberry thickets. In addition, the northern and eastern boundaries of the project site have been routinely mowed by the adjacent neighbor in what best appeared an attempt to control the spread of blackberries from the project site offsite to the north and east.

The depression within the northeastern portion of the project site exhibited a plant community typically associated with damp to saturated soils. Observed species included black cottonwood, crabapple (*Pyrus fusca*), black twinberry (*Lonicera involucrata*), salmonberry (*Rubus spectabilis*), Douglas spiraea (*Spiraea douglasii*), hairy nightshade (*Solanum sarrachoides*), speedwell (*Veronica* spp.), buttercup (*Ranunculus repens*), and reed canarygrass (*Phalaris arundinacea*). This plant community was identified as hydrophytic in character (i.e. typical of wetlands).

- **Wildlife**

Wildlife species observed onsite during the present and prior assessments, as well as those species that would be reasonably expected to utilize the habitats provided within or adjacent to the project site would include red tailed hawk (*Buteo jamaicensis*), American crow (*Corvus brachynchos*), Northern flicker (*Colaptes auratus*), Steller's jay (*Cyanocitta stelleri*), American robin (*Turdus migratorius*), black capped chickadee (*Parus atricapillus*), rufous-sided towhee (*Pipilo erythrophthalmus*), dark eyed junco (*Junco hyemalis*), rufous hummingbird (*Selasphorus rufus*), common raven (*Corvus corax*), merlin (*Falco columbarius*), mourning dove (*Zenaida macroura*), chestnut backed chickadee (*Parus rufescens*), black-capped chickadee (*Parus atricapillus*), golden crowned sparrow (*Zonotrichia atricapilla*), song sparrow (*Melospiza melodia*), white crowned sparrow (*Zonotrichia leucophrys*), red winged blackbird (*Agelaius phoeniceus*), rock dove (*Columbia livia*), house finch (*Carpodacus mexicanus*), starling (*Sturnus vulgaris*), American goldfinch (*Carduelis tristis*), purple finch (*Carpodacus purpureus*), violet green swallow (*Tachycineta thalassina*), tree swallow (*Tachycineta bicolor*), great blue heron (*Ardea herodias*), common mallard (*Anas platyrhynchos*), Canada goose (*Branta canadensis*), marsh wren (*Cistothorus palustris*), black tailed deer (*Odocoileus hemionus*), raccoon (*Procyon lotor*), coyote (*Canis latrans*), striped skunk (*Mephitis mephitis*), opossum (*Didelphis virginianus*), deer mouse (*Peromyscus maniculatus*), shrew (*Sorex* spp.), Townsend mole (*Scapanus townsendii*), bats (*Myotis* spp.), voles (*Microtus* spp.), Norway rat (*Rattus norvegicus*), and bats (*Myotis* spp.).

The project site would also provide habitats for Pacific treefrog (*Hyla regilla*) and common garter snake (*Thamnophis sirtalis*).

The project site has not been documented to provide direct habitats for fish species.

Wildlife Movement Corridors: The project site was within an area of residential and increasing commercial development. As identified by onsite wildlife trials, small, medium, and large mammals appeared to be moving throughout the project site. However, the project site does not appear to provide a seasonal mitigation corridor for mammals. The project site is also within the general area of the migratory movement of passerine birds and waterfowl.

State Priority Species: Several species identified by the State of Washington as "Priority Species" were observed onsite or potentially may utilize the project site. Priority species require protective measures for their survival due to their population status, sensitivity to habitat alteration, and/or recreational, commercial, or tribal importance.

Game Species: "Game species" are regulated by the State of Washington through recreational hunting bag limits, harvest seasons, and harvest area restrictions. Observed or documented "game species" within and adjacent to the project site included black-tailed deer, common mallard, Canada goose, and mourning dove.

State Monitored: State Monitored species are native to Washington but require habitat that has limited availability, are indicators of environmental quality, require further assessment, have unresolved taxonomy, may be competing with other species of concern, or have significant popular appeal. State Monitored species – great blue heron – may potentially utilize the habitats associated with the wetland.

State Candidate: State Candidate species are presently under review by the State of Washington Department of Fish and Wildlife (WDFW) for possible listing as endangered, threatened, or sensitive. No State Candidate species would be expected to use the habitats within the project site.

State Sensitive: State Sensitive species are native to Washington and is vulnerable to declining and is likely to become endangered or threatened throughout a significant portion of its range without cooperative management or removal of threats. No State Sensitive species were observed as a part of this assessment. However, bald eagles (*Haliaeetus leucocephalus*) are documented to use the habitats along the Puyallup River Corridor and the Clarks Creek Corridor. As such, this species may overfly the project site.

State Threatened: State Threatened species means any wildlife species native to the state of Washington that is likely to become an endangered species within

the foreseeable future throughout a significant portion of its range within the state without cooperative management or removal of threats. The project site did not appear to provide direct critical habitats for State Threatened species.

State Endangered: State endangered species means any species native to the state of Washington that is seriously threatened with extinction throughout all or a significant portion of its range within the state. The project site did not appear to provide direct critical habitats for State Endangered species.

Federally Listed Species: The project site has not been documented to provide critical habitats for federally listed species. A single, federally listed species of concern – bald eagle – has been documented to use the habitats associated with the Puyallup River Corridor and Clarks Creek Corridor.

As noted above, the eastern portion of the project site has been mapped as dominated by Indianola loamy sand which has been defined to potentially support Mazama pocket gophers. During prior assessments of the project site completed by Habitat Technologies there was no documented observations of the potential presence of this species. The entire project site - along with the adjacent parcels - has been managed for several years and has not been documented to provide critical habitats for this species. In addition, absent routine mowing and other management actions the project site and adjacent parcels would be dominated by dense thickets of invasive species which would over time convert into mixed forested area. The project site was also surrounded by existing and increasing urban development such that the movement of this species into the project site would not be reasonably expected.

CRITICAL AREAS DETERMINATION

WETLANDS

Wetland determination was based on observations of hydrophytic vegetation, hydric soils, and wetland hydrology in accordance with the United States Army Corps of Engineers, 1987 and United States Army Corps of Engineers, 2010. Based on these observations one area within the project site was identified to exhibit all three of the established wetland criteria.

WETLAND	CLASSIFICATION (USFWS)	CITY OF PUYALLUP CATEGORY	WDOE RATING SCORE	WDOE HABITAT SCORE	BUFFER WIDTH (high intensity)
A	PFOC/PEMC	4	15	4	50 feet

Wetland A: Wetland A was identified within the northeastern portion of the project site within an isolated, topographic depression. Wetland A was dominated by a dense stand of black cottonwood around the perimeter and by primarily reed canarygrass within the interior. This wetland also included a variety of intermixed small clusters of sapling

trees and shrubs. Wetland hydrology was provided by seasonal stormwater sheetflow, potentially by groundwater, soils characteristics, and the lack of an outlet for this isolated topographic depression.

Wetland A met the U.S. Fish and Wildlife Service (USFWS) criteria for classification of palustrine, forested, seasonally flooded (PFOC); and palustrine, emergent, seasonally flooded (PEMC). Wetland A appeared to meet the criteria for designation as a City of Puyallup Category 4 Wetland. Wetland A achieved a total functions score of 15 points utilizing the Washington State Department of Ecology (WDOE) Wetland Rating Form for Western Washington (Appendix B).

FISH AND WILDLIFE HABITAT AREAS

As defined by onsite assessment, prior assessments, and a review of existing resource agency information the project site was identified to provide very limited fish and wildlife habitat areas.

- The project site has not been documented and has not been observed to provide critical habitats which state or federally designated endangered, threatened, and sensitive species have a primary association.
- The project site has not been documented and has not been observed to provide habitats of local importance, including but not limited to areas designated as priority habitat by the Department of Fish and Wildlife.
- The project site has not been documented and has not been observed to provide land essential for preserving connections between habitats and open spaces.
- The project site has not been documented and has not been observed to exhibit a stream which would be within the jurisdiction of the State of Washington.
- The project site has been identified to exhibit a wetland. This wetland would be considered within the jurisdiction of the State of Washington.

SELECTED DEVELOPMENT ACTION

The *Selected Development Action* for the project site (Parcel 0419043091) has not yet been fully defined. As presently understood, the future development of the project site may be completed without direct adverse impact to the identified onsite Category III Wetland or is associated buffer as identified within the City of Puyallup Chapter 21.

STANDARD OF CARE

This document has been completed by Habitat Technologies for use by **Abbey Road Group Land Development Services Company LLC**. Prior to extensive site planning the findings documented in this document should be reviewed and verified by the City of Puyallup. Habitat Technologies has provided professional services that are in accordance with the degree of care and skill generally accepted in the nature of the work accomplished. No other warranties are expressed or implied. Habitat Technologies is not responsible for design costs incurred before this document is approved by the appropriate resource and permitting agencies.
