

VESDA-E VEU

The VEU series of aspirating smoke detectors are the premium detector of the VESDA-E range. An Ultra-wide sensitivity range; 15 times greater than VESDA VLP, and provision for more sampling holes provide an increased coverage in high airflow applications by at least 40%. Considerably longer linear pipe runs and extended branched pipe network configurations cater perfectly to applications with higher ceilings providing an increased coverage by up to 80% whilst allowing convenient detector mounting for ease of service and maintenance. A range of revolutionary new features provide unsurpassed detection performance, flexibility, field programmability, connectivity and reduced total cost of ownership.

Flair Detection Technology

Flair is the revolutionary new detection chamber that forms the core of VESDA-E VEU, providing better detection, fewer nuisance alarms, higher stability, increased longevity and particle characterisation. Direct imaging of the sampled particles using a CMOS imager combined with multiple photo-diodes provides vastly more data that can be used to derive actionable information about the observed particles using analytics.

Installation, Commissioning and Operation

VESDA-E VEU features a robust IP40-rated enclosure and is equipped with a powerful aspirator that provides a total pipe length of 800 m (2,624 ft). Out of box operation is made possible with AutoConfig which allows airflow normalisation and AutoLearn Smoke and Flow to be initiated from within the detector. VEU is fully supported by the ASPIRE and Xtralis VSC software applications which facilitate ease of pipe network design, system commissioning and maintenance.

VESDAnet™

VESDA devices communicate on VESDAnet which provides a robust bi-directional communication network allowing continued redundant operation even during single point wiring failures. VESDAnet enables primary reporting, centralized configuration, control, maintenance and monitoring.

Ethernet and WiFi connectivity

VESDA-E detectors offer Ethernet and WiFi connectivity as standard features. The detector can be added to a corporate network, allowing WiFi enabled tablet devices and laptops installed with Xtralis configuration software to connect wirelessly to the detector via the network.

Backward Compatibility

VESDA-E VEU is fully compatible with existing VESDA installations. The detector occupies the same mounting footprint, pipe, conduit and electrical connector positioning as VESDA VLP. VEU is also compatible with existing VESDAnet installations allowing monitoring of both VESDA-E and legacy detectors via the latest iVESDA application.

VEU-A00, VEU-A10

Features

- Flair detection technology delivers reliable very early warning in a wide range of environments with minimal nuisance alarms
- Multi stage filtration and optical protection with clean air barriers ensures lifetime detection performance
- Four alarm levels and an ultra wide sensitivity range deliver optimum protection for the widest range of applications
- Intuitive LCD icon display provides instant status information for immediate response
- Flow fault thresholds per port accommodate varying airflow conditions
- Smart on-board filter retains dust count and remaining filter life for predictable maintenance
- Extensive event log (20,000 events) for event analysis and system diagnostics
- AutoLearn™ smoke and flow for reliable and rapid commissioning
- Referencing to accommodate external environmental conditions to minimise nuisance alarms
- Fully backward compatible with VLP and VESDAnet
- Remote monitoring with iVESDA for system review and proactive maintenance
- Ethernet for connectivity with Xtralis software for configuration, secondary monitoring and maintenance
- Industry first. Aspirating detector secondary monitoring and maintenance via WiFi
- USB for PC configuration, and firmware upgrade using a memory stick
- Two programmable GPs (1 monitored) for flexible remote control
- Field replaceable sub-assemblies enable faster service and maximum uptime

VESDA-E VEU Installation Instructions

These installation instructions provide essential information for installing VESDA-E VEU Aspirating Smoke Detectors in accordance with the system design. Additional installation product documentation is listed below in the Reference Documents section.

System Components

The detector is shipped with the following components:

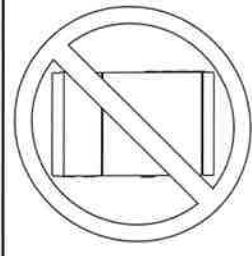

- 1 aspirating smoke detector
- 1 mounting bracket
- 1 mounting template for directly mounting the detector to the mounting surface
- 1 End of Line Resistor for the monitored GPI
- 1 installation instruction sheet

Prerequisites

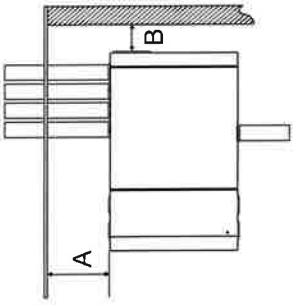

- A completed system design.
- A 24V DC Power Supply, compliant with local codes and standards.
- Screws and inserts that are appropriate for the mounting surface.
- Type A to Type B USB Interface Lead for initial configuration of the detector.
- Labels as specified in the system design, e.g. Sampling Point labels
- Cable glands that are compliant with the IP rating of the detector.
- Conduit, as specified in the system design.
- 0.2 mm² to 2.5 mm² (24 - 14 AWG) wiring for relays.
- A PC or laptop installed with Xtralis VSC for initial configuration.
- Standard connection instructions for where the detectors are to be added to a corporate network.

Installation Instructions

Notes

- The VESDA-E detector can be mounted in an upright or inverted position. Do not mount the detector with a sideways orientation.
- Ensure the mounting surface is flat as this allows air tight seal to be achieved between the sampling pipe and the tapered air inlet pipes on the detector.
- Refer to the detector Product Guide for information on inverted mounting.

- Ensure that there is sufficient clearance to mount the detector, noting the location of air sampling pipes and cable entry points. Due to the rigid nature of the plastic pipe, installation must provide for sufficient movement in all pipework (air inlet, air exhaust and cable pipes) to allow pipe ends to easily fitted and removed.
- **A:** Minimum 50 mm (2 in.) below ceiling level
- **B:** The detector can be mounted directly against a wall or obstruction.

Standards Compliance

UL and ULC

For open area, open area high velocity and duct protection the fire alarm threshold (setting) that initiates an evacuation signal must be set such that the sensitivity of each sampling hole is more sensitive than 10%/m (3.2 %/ft) as determined by the ASPIRE software.

European Installations

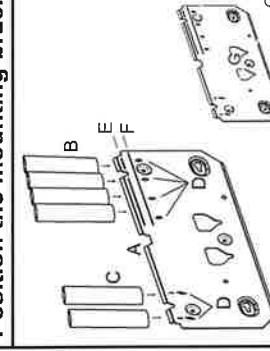

EN 54-20

The product must use a power source conforming to EN 54-4 and EN60950-1 Section 2.5. The product is compliant with EN 54-20 sensitivity requirements provided the following conditions are met:

- For a Class A detector, hole sensitivity must be better than 1.5% obscuration/m and transport time less than 70 seconds
 - For a Class B detector, hole sensitivity must be better than 3% obscuration/m and transport time less than 90 seconds
 - For a Class C detector, hole sensitivity must be better than 10% obscuration/m and transport time less than 110 seconds
- These limits should be verified using ASPIRE during the design of the sampling pipe network.
- The product is compliant with EN 54-20 flow monitoring requirements provided the

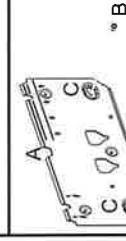

Attach the detector to the wall using the mounting bracket

Position the mounting bracket as specified by the system designer

- Position the mounting bracket (A) to allow sampling pipes (B) and electrical conduit (C) to line up horizontally with the alignment marks (D) and vertically with the appropriate pipe depth line.
- 3/4 inch IPS (1.05 inch OD) sampling pipe should vertically align with the top depth line (E).
- 25 mm OD sampling pipe should vertically align with the bottom depth line (F).
- Hold the plate in position and mark positions for 5 screw holes (G) on the mounting surface. Remove the plate and drill holes. Insert plug required.

Secure the mounting bracket to the mounting surface

- Align the mounting plate with the holes. Ensure that the plate is level.
- Insert and tighten two screws (B) in the key slots (C) followed by three screws (D) in the

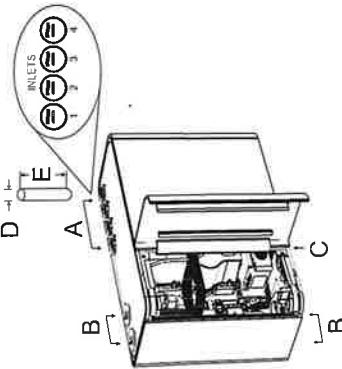

VESDA-E VEU Installation Instructions

Prepare Detector:

Wiring, Pipe Inlet and Exhaust Ports

Remove the appropriate plugs for electrical cable installation (B), air sampling pipe inlet ports (A), and exhaust port (C).

- Where the system design requires less than four air sampling pipe inlet ports, use ports 2 and 3 before using ports 1 and 4.
- Do not remove the plugs from inlet ports that will not be used.
- Ensure that pipes are clean and their ends are square and smooth.

A	Inlet Port, Qty 4
B	Cable Entry Port, Qty 4, 26 mm (1")
C	Exhaust Port, OD 25 mm or 1.05" (3/4" IPS) via adaptor
D	Inlet Pipe Diameter: OD 25 mm or 1.05" (3/4" IPS)
E	Minimum Inlet Pipe Length: 500mm (19.6")

Note: To remove the pipe inlet and cable

entry port plugs, place a large screwdriver in the large slot and twist, or use a small screwdriver in the side slots to lever the plug out.

- Insert the inlet and exhaust pipes (if used) into the correct inlet ports (A) and exhaust port.

Exhaust pipe should be as short as possible.

- Feed the electrical wiring connections through the cable entry ports.
- Use the correct cable gland size to fit into the 26 mm (1") cable entry port. Use correctly rated cable glands to maintain the required IP rating.

Note:

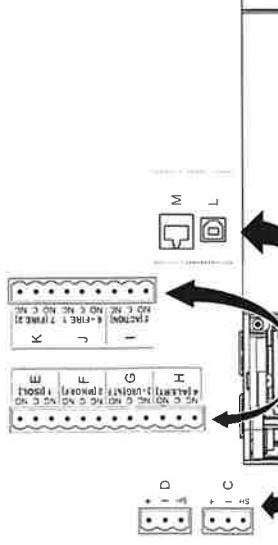

Do not glue the inlet and exhaust pipe into the detector ports. The product warranty will be void if the pipes are glued.

Wiring:

Power, Relays, GPI, Loop Module, VESDAnet, Standalone Detector

Warning: Always switch detector power OFF before plugging/unplugging electrical, relay or network connections. Failure to do so may cause data corruption and/or component failure.

Avertissement : Eteignez toujours détecteur avant de brancher/débrancher les relais électriques, ou de connexions réseau. Au cas contraire vous pourrez entraîner la défaillance corruption et/ou élément de données.

Unmonitored GPI

The Unmonitored GPI is a programmable input which can be configured to initiate a number of different actions, including, by default, a Remote Reset function.

Monitored GPI

The monitored GPI senses contact closure and is configurable to initiate the same actions as the unmonitored GPI. "Mains OK" is the default setting. A closed contact signals G ON and open contact signals GPI OFF.

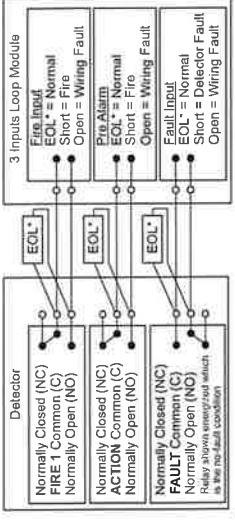

A 10K end of line resistor is used to allow the detector to monitor for open circuit fault the wiring from the detector to the contact.

Connection to Addressable Loop Module for Reporting Alarms and Faults

This wiring example is for wiring VESDAnet detectors to a typical third party Input / Module with three inputs.

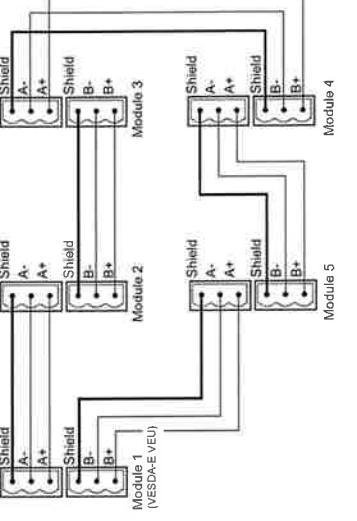

This is an example drawing. Refer to the appropriate product manual for the exact wiring details of the third party equipment.

* EOL = End of Line Resistor

Connection to VESDAnet

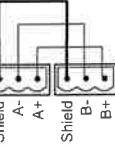

The diagram shows an example of the wiring for a closed VESDAnet loop, which is the recommended configuration. Refer to the factory default A and B links from the VESDAnet sockets (C and D) prior to connecting the detector to the VESDAnet. It is recommended that 120 Ohm twisted pair cables (e.g. Belden 9841) be used including the devices in the network, with a maximum length between devices of 1.2 km. The polarity of the data wires must be maintained throughout the network.

Standalone Detector

The diagram below shows the factory default wiring for VESDAnet sockets (C and D) as required for a detector that is not connected to VESDAnet.

- Leave as is, or replace if it has been removed.

Communications

- USB:** The USB port (L) is used for initial configuration and local maintenance or servicing of the detector using a PC or laptop installed with Xtralis VSC software. The Xtralis VSC prior to connecting the detector to the computer. This ensures that the required USB drivers are present.
- Ethernet:** The Ethernet port (M) is used for permanent network communication to the detector.

Note to User: Yellow highlighted cells require user
input per system design
