STORM DRAINAGE

1. Project Overview

This report accompanies the Short Plat Amendment, Boundary Line Adjustment, and building site plan submittals prepared for the Puyallup Duplex Lot 1 and Lot 2 project which are submitted to the City of Puyallup for review and approval. This document provides site information, and the analysis used to prepare the storm drainage design for each proposed duplex. The *Washington State Department of Ecology 2019 Stormwater Management Manual for Western Washington, (SWMMWW)*, and the City of Puyallup's modifications to that document establishes the methodology and design criteria used for this project.

The proposed Puyallup Duplexes project is comprised of 3 vacant parcels (0419095003, 0419095004, and 0419095022) totaling approximately 5.02 acres. Along with building site plan submittals for each duplex, there are 2 other land use actions proposed for the project. A Short Plat Amendment will be completed to create 2 newly configured lots (Lots 1 and 2) and a Native Growth Protection area tract (Tract A). Once the Short Plat Amendment is completed a Boundary Line Adjustment will be completed affecting newly created Lot 2. The boundary line adjustment will decrease the east side of Lot 2 and expand the western boundary of adjacent Parcel 0419091020 to account for an existing asphalt pavement parking area used by the adjacent apartment building that encroaches into Parcel 0419095022. A frontage improvement plan consisting of a proposed 5' wide asphalt pavement sidewalk on the north side of 43rd Ave. SW along with a street light plan will be submitted in conjunction with the above-described land use actions.

The Puyallup Duplexes project proposes 2 residential duplex buildings containing a total of 4 living units. One duplex building will be constructed on each newly configured lot. The site will be accessed from 43rd Ave. SW by a new 24' wide asphalt driveway approach. The new asphalt driveway approach will connect to a proposed 24' wide by 40' long shared access driveway constructed onsite centered on the common lot line of proposed Lots 1 and 2. Individual 20' wide driveways will extend in each direction from the shared access to the garages of each duplex. A minimum of 20' wide by 20' deep apron will be constructed in front of each garage providing a minimum of 2 parking spaces per unit. The site will be complete with sidewalks extending from the garage aprons to the front entrance of each unit.

A Vicinity Map has been included in Appendix "A" of this report. A project summary is as follows:

Permit Applied for – Building Permits							
Address –	409 and 433 43 rd Ave. SW, Puyallup, WA 98373						
Parcel Numbers –	0419095003, 0419095004, 0419095022						
Legal description -	- PER CITY OF PUYALLUP BOUNDARY LINE ADJUSTMENT NO. PLBDJ20220164. PENDING RECORDING.						

The project proposes to create approximately 0.266 acres of impervious surface consisting of approximately 0.167 acres of rooftops and 0.099 acres of shared access, driveways, parking spaces, and sidewalks. All disturbed pervious areas that are not converted to impervious surfaces will apply soil amendment per Ecology BMP T5.13.

New water services and meters will be installed for each duplex and unit. Installation will be coordinated with Fruitland Mutual Water Company.

Onsite septic systems for each lot/duplex were originally designed by Peninsula Septic Designs and received health department approval on January 20, 2021 and January 21, 2021, respectively. Approvals subsequently expired and were re-applied for by C.E.S. NW, Inc. and re-approved on June 12, 2023.

A Fee-in-Lieu Program Request was submitted but denied by the city. As a result, the project is required to complete frontage improvements along the north side of 43rd Ave. SW consisting of a 5' wide asphalt pavement sidewalk adjacent to the edge of right of way. The 5' wide paved sidewalk will connect to the proposed 24' wide asphalt pavement driveway approach.

According to Figure I-3.1 of Volume I, Chapter 3 of the SWMMWW, the project must evaluate all minimum requirements. See Section 5 of this report for a detailed discussion of the minimum requirements.

2. Existing Conditions Summary

The project site is rectangular in shape and approximately 5.02 acres in size. The existing topography of the southern portion of the site is generally rolling sloping downward from south to north. The existing wetland area comprising most of the site is generally flat. The existing site elevations range between approximately 418-ft. to 434-ft. Due to existing topography, there is P(2006) (Reports) 2 - Storm Report - Puyallup Duplexes 10.6.2023.docx 2

minimal offsite drainage coming onto the site but what does is coming from the north half of 43rd Ave. SW and the offsite parking lot east of proposed Lot 2. Most of the site is covered with trees and brush. The site is bordered by 43rd Ave. SW to the south, a multi-family and single-family residences to the east, and undeveloped land to the north and west.

A Artz Site and Soil Evaluation was prepared by Innovative GEO-Services, LLC on January 29, 2020. The intent of the evaluation was to present site and soil characteristics with regard to potential critical areas located on site. Per the evaluation, "Site observations, subsurface soil observations and research conducted for the three lots and specifically the two southern parcels found no critical areas as defined by the City of Puyallup ordinance. The Soil Evaluation indicates the Natural Resource Conservation Service (NRCS) identifies the soil on the southern two lots as Everett gravelly sandy loam (13B) and that test pits excavated north and east of the proposed structure as a portion of the wastewater permitting phase confirmed soil typical of Everett gravelly sandy loam. See Geotechnical Reports – Appendix "E" for complete information provided within the Artz Site and Soil Evaluation.

An Infiltration Evaluation and Seasonal Groundwater Monitoring study was prepared by Earth Solutions NW (ESNW) on March 30, 2023. Summarizing, the study concluded that soils in the location of the proposed infiltration trench located in the southwest corner of Lot 1 support a design infiltration rate of 30 inch/hour and a recommended seasonal high groundwater table elevation of 6.7 feet below ground surface. See Geotechnical Reports – Appendix "E" for complete information provided within the Infiltration Evaluation and Seasonal Groundwater Monitoring study.

A Critical Areas Assessment was prepared by Habitat Technologies for $409 - 43^{rd}$ Ave. SW and $433 - 43^{rd}$ Ave. SW on October 7, 2020 and September 18, 2020, respectively. The Critical Areas Assessment identified the project contains an existing onsite wetland (Wetland A). Wetland A has been identified as a Category III wetland requiring a standard 60-ft. wetland buffer by the City of Puyallup. See Critical Areas Assessment – Appendix "D" for complete information provided within the assessment.

There are no known septic systems or fuel tanks in use or abandoned on the project site. If either are found during site construction, they will be removed or abandoned per all appropriate city and health department standards.

Federal Emergency Management Agency (FEMA) has prepared flood insurance maps identifying floodplains within the City of Puyallup. Based on FIRM map 53053C0343E), The parcel and all the proposed improvements are located within Zone X, which is the area determined to be outside the 500-year flood and protected by levee from the 100-year flood. A copy of the FIRM Panel 53053C0343E can be found in Appendix "A" of this report.

3. Off-site Analysis Report

As previously indicated, from site reconnaissance and existing topography, there is minimal offsite drainage coming onto the site. But what does is coming from the north half of 43rd Ave. SW and the offsite parking lot east of proposed Lot 2. A quarter mile downstream analysis is required by the City of Puyallup. Due to the infiltration characteristics of the onsite soils (Everett gravelly sandy loam), all the stormwater from the site will be fully infiltrated to the groundwater or evaporated within the wetland, where the ¹/₄ miles downstream limit ends.

4. Permanent Stormwater Control Plan

Existing Site Hydrology

The existing topography of the southern portion of the site is generally rolling sloping downward from south to north. The existing wetland area comprising most of the site is generally flat. The existing site elevations range between approximately 418-ft. to 434-ft. Due to existing topography, there is minimal offsite drainage coming onto the site but what does is coming from the north half of 43rd Ave. SW and the offsite parking lot east of proposed Lot 2. The Soil Evaluation indicates the Natural Resource Conservation Service (NRCS) identifies the soil on the southern two lots as Everett gravelly sandy loam (13B) and that test pits excavated north and east of the proposed structure as a portion of the wastewater permitting phase confirmed soil typical of Everett gravelly sandy loam. Most of the project site appears to be well drained and does not exhibit field indicators associated with the movement of seasonal stormwater runoff.

Developed Site Hydrology

As previously mentioned, the site consists of an existing onsite wetland (Wetland A) as identified in the Critical Areas Assessment prepared by Habitat Technologies. Per the requirements of the 2019 SWMMWW the project is required to satisfy Minimum Requirement #8 by maintaining wetland hydrology to the existing wetland. **Figure I-3.5: Flow Chart for Determining Wetland** Protection Level Requirements within the 2019 SWMMWW states a Category III or IV wetland with a habitat score of 5 or less that does not provide habitat for rare, endangered, threatened, or sensitive species or does not contain a breeding population of any native amphibian only need to provide the required Wetland Protection Level consisting of General Protection and Protection from Pollutants. Wetland A has a habitat score of 5 and does not provide habitat for rare, endangered, threatened, or sensitive species. However, the Critical Areas Assessment report identifies Wetland A as depressional and is assumed to have a breeding population of amphibians per the 2019 SWMMWW. Therefore, Wetland A requires hydroperiod protection and Appendix I-C.4: Wetland Hydroperiod Protection within the 2019 SWMMWW establishes the design criteria for wetlands protection. Specifically, Method 2: Site Discharge Modeling provides two criteria, Criteria 1 and Criteria 2, for maintaining stormwater volumes to existing wetlands. When modeling the differences in stormwater volume to a wetland under existing and developed scenarios, the manual instructs the designer to analyze the effects of surface, interflow, and groundwater. In addition, the existing land use coverages were used for modeling purposes. Utilizing WWHM2012, a hydrology analysis was completed for Wetland A to show compliance with Criteria 1 and Criteria 2. To achieve compliance in the field, developed stormwater runoff from one of the duplexes roof surfaces and most of the landscaped areas were directed to the existing wetland in addition to existing offsite stormwater runoff using a combination of interceptor trenches, stormwater dispersal trench, riprap outfall, and finish grading. The result is compliance of all months and days meeting their respective exceedance requirements. See Basin Exhibits - Appendix "B" and Wetland A Hydrology Analysis - Appendix "C" for detailed stormwater information. The stormwater dispersal trench and riprap outfall both have a minimum 25' vegetated flow path meeting the requirements of basic dispersion. Since Wetland Protection (Minimum Requirement #8) supersedes the Flow Control (Minimum Requirement #7) standard neither outfall to the wetland is intended to meet the full dispersion standard and are only utilized for maintaining hydroperiod of the existing wetland. Both the stormwater dispersal trench and riprap outfall are located within the outer 25% of the required 60' wetland buffer.

Developed stormwater runoff from the remaining roof surface and shared access, driveways, parking spaces, sidewalks, and landscape will be directed to a proposed infiltration trench located in the southwest corner of Lot 1. In addition to the onsite area the infiltration trench is sized to infiltrate offsite stormwater runoff from the proposed asphalt driveway approach and the north half of 43rd Ave. SW that flows onto the driveway approach. The infiltration trench was sized utilizing WWHM2012 and a design infiltration rate of 30 inches per hour provided by ESNW. Per WWHM P:\20069\Reports\02 - Storm Report-Puyallup Duplexes 10.6.2023.docx 5

modeling program a 21' long x 10' wide x 3' deep infiltration trench is required to infiltrate developed and existing stormwater runoff from the previously mentioned areas. See Basin Exhibits – Appendix "B" and Stormwater Calculations – Appendix "C" for detailed stormwater information.

A dispersal trench stormwater flow calculation has been provided in Appendix "C" supporting the design length of the proposed trench. Trench length has been adjusted to sufficiently convey 0.1 cfs per 10' of trench length which is the ratio derived from a 50' trench length being able to convey a maximum 0.5 cfs.

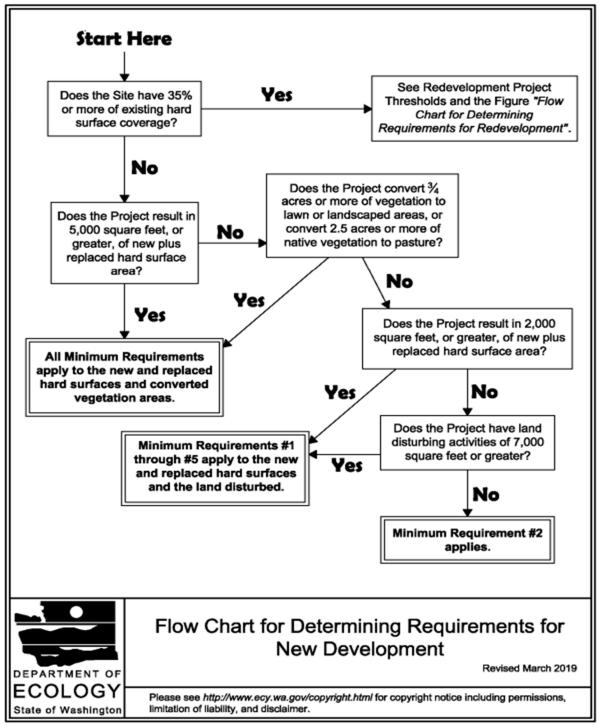

Water Quality System

Water quality treatment mitigation is not required as the project proposes to create less than 5,000 square feet of pollution-generating hard surface (4,581 sf) and does not create 3/4 of an acre or more of pollution-generating pervious surfaces.

5. Discussion of Minimum Requirements

The following is a summary of the Minimum Requirements as described in Volume 1, Chapter 3 of the SWMMWW. Minimum requirements #1 through #9 must be met according to Figure I-3.1.

5.1 Minimum Requirement #1: Preparation of Stormwater Site Plans

Minimum Requirement #1 is satisfied by the completion of this Stormwater Site Plan as submitted for approval of the Short Plat Amendment and building permits for each proposed duplex.

5.2 Minimum Requirement #2: Construction Stormwater Pollution Prevention (SWPPP) Minimum Requirement #2 will be satisfied by the separately completed and approved Construction Stormwater Pollution Prevention Plan (SWPPP) addressing all thirteen (13) elements and will be provided during building site plan submittal.

5.3 Minimum Requirement #3: Source Control of Pollution

Minimum Requirement #3 will be satisfied by the separately prepared SWPPP report and the separately prepared Pollution Source Control Manual for Homeowners which is included as part of the Stormwater Site Plan as Attachment "B" and will be provided during building site plan submittal.

5.4 Minimum Requirement #4: Preservation of Natural Drainage Systems and Outfalls

Minimum Requirement #4 is satisfied by maintaining to the maximum extent practical, the natural drainage patterns and the natural discharge locations by proposing to discharge developed stormwater runoff to the groundwater through an infiltration trench and to the existing wetland through the use of a stormwater dispersal trench and riprap outfall which is the historic discharge location of the site.

5.5 Minimum Requirement #5: Onsite Stormwater Management

The City of Puyallup requires projects to implement onsite stormwater management BMPs when feasible. This project must meet minimum requirements #1 to #9. Therefore, this project will evaluate List 2 of the SWMMWW for onsite stormwater management compliance. These BMPs were evaluated and discussed as follows:

Lawn and Landscape Areas

Soil Preservation and Amendment (Ecology BMP T5.13)

All disturbed pervious areas that are not converted to impervious surfaces will apply soil amendment per Ecology BMP T5.13.

Roof Areas

- Full dispersion is deemed feasible since the developed site maintains 65% of forested or native condition. However, full dispersion is not feasible as 100-foot flow paths are not available.
- Downspout full infiltration is deemed feasible and will be utilized for one of the duplexes roof surfaces.
- Other BMPs are not necessary since downspout full infiltration has been proposed above and has higher priority.

Other Hard Surface

- Full dispersion of BMP T5.30 was deemed feasible since the developed site maintains 65% of forested or native condition. However, full dispersion is not feasible as 100-foot flow paths are not available.
- Permeable Pavement BMP is deemed infeasible and not proposed for the shared access and individual driveways as the soil conditions in this area do not support infiltration systems according to the Infiltration Evaluation and Seasonal Groundwater Monitoring report prepared by ESNW.
- Other BMPs are not necessary as all developed stormwater runoff has been retained onsite.

5.6 Minimum Requirement #6: Runoff Treatment

Minimum Requirement #6 is not required as the project proposes to create less than 5,000 square feet of pollution-generating hard surface (4,581 sf) and does not create 3/4 of an acre or more of pollution-generating pervious surfaces.

5.7 Minimum Requirement #7: Flow Control

Minimum Requirement #7 is required as the project proposes more than 10,000 square feet of effective impervious surface and will be satisfied using an infiltration trench to mitigate developed stormwater runoff not needed for hydroperiod protection of the existing onsite wetland. Flow control design was determined utilizing WWHM2012.

5.8 Minimum Requirement #8: Wetlands Protection

Minimum Requirement #8 is required due to the project containing an existing onsite wetland (Wetland A) as identified in the Critical Areas Assessment prepared by Habitat Technologies. Wetland A has been identified as a Category III wetland requiring a standard 60-ft. wetland buffer

by the City of Puyallup. Per the requirements of the 2019 SWMMWW the project is required to satisfy MR8 by maintaining wetland hydrology to the existing wetland. Figure I-3.5: Flow Chart for Determining Wetland Protection Level Requirements within the 2019 SWMMWW states a Category III or IV wetland with a habitat score of 5 or less that does not provide habitat for rare, endangered, threatened, or sensitive species or does not contain a breeding population of any native amphibian only need to provide the required Wetland Protection Level consisting of General Protection and Protection from Pollutants. Wetland A has a habitat score of 5 and does not provide habitat for rare, endangered, threatened, or sensitive species. However, the Critical Areas Assessment report identifies Wetland A as depressional and is assumed to have a breeding population of amphibians per the 2019 SWMMWW. Therefore, Wetland A requires hydroperiod protection and Appendix I-C.4: Wetland Hydroperiod Protection within the 2019 SWMMWW establishes the design criteria for wetlands protection. Specifically, Method 2: Site Discharge Modeling provides two criteria, Criteria 1 and Criteria 2, for maintaining stormwater volumes to existing wetlands. When modeling the differences in stormwater volume to a wetland under existing and developed scenarios, the manual instructs the designer to analyze the effects of surface, interflow, and groundwater. In addition, the existing land use coverages were used for modeling purposes. Utilizing WWHM2012, a hydrology analysis was completed for Wetland A to show compliance with Criteria 1 and Criteria 2. To achieve compliance in the field, developed stormwater runoff from one of the duplexes roof surface and landscaped areas were directed to the existing wetland in addition to offsite existing stormwater runoff using a combination of interceptor trenches, stormwater dispersal trench, riprap outfall, and finish grading. The result is compliance of all months and days meeting their respective exceedance requirements. As previously mentioned, the stormwater dispersal trench and riprap outfall both have a minimum 25' vegetated flow path meeting the requirements of basic dispersion. Since Wetland Protection supersedes the Flow Control standard neither outfall to the wetland is intended to meet the full dispersion standard and are only utilized for maintaining the hydroperiod of the existing wetland.

5.9 Minimum Requirement #9: Operation and Maintenance

Minimum Requirement #9 will be satisfied by the separately prepared Operation and Maintenance Manual for Drainage Facilities which will be provided during the building site plan submittal.

INTRODUCTION

This document details the culmination of activities and onsite evaluations undertaken to complete a critical areas assessment (i.e. wetlands, streams, fish and wildlife habitats) of **Parcel 0419095003** and a septic easement area within parcel 0419091068 (**Project site**). The project site was located at 433 - 43rd Avenue SW within the City of Puyallup, Pierce County, Washington (Figure 1). The evaluation and characterization of onsite and adjacent critical areas is a vital element in land use planning. The goal of this approach is to ensure that the proposed development of a single duplex and associated primary and reserve septic drainfield areas does not result in adverse environmental impacts to an identified City of Puyallup Category III Wetland and the associated 60-foot standard City of Puyallup buffer identified within the project site. As presently proposed all development activities would be accomplished without an encroachment into the identified wetland or associated 60-foot buffer.

The assessment and delineation of specific critical areas within and immediately adjacent to the project site followed the methods and procedures defined in the *Corps of Engineers Wetland Delineation Manual* (United States Army Corps of Engineers, 1987) with the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region* (United States Army Corps of Engineers, 2010); the Washington State *Wetland Rating System for Western Washington* (Hruby, 2014), the State of Washington Department of Natural Resources (WDNR) Forest Practice Rules (WAC 222-16-030), and the City of Puyallup Chapter 21. This document was designed to accommodate site planning and potential regulatory actions and is suitable for submittal to federal, state, and local authorities for potential critical areas verification and permitting actions.

PROJECT SITE DESCRIPTION

The project site was composed of an existing vacant parcel of record totaling approximately 1.25-acres in size. As outlined below the majority of the project site was encumbered by wetland and wetland buffers. The project site was located within an area of increasing urbanization focusing on more intense commercial retail and higher intensity residential development. The southern boundary of the project site was formed by 43rd Avenue SW. A single-family homesite on a large parcel was noted to the west and vacant lands were present to the north and east.

Directions to Project Site: From Meridian Avenue East (southbound) turn west onto 43rd Avenue SW. Continue on 43rd Avenue SW to the project site at 433 - 43rd Avenue SW.

BACKGROUND INFORMATION

NATIONAL WETLAND INVENTORY

The National Wetland Inventory (NWI) Mapping completed by the U.S. Fish and Wildlife Service was reviewed as a part of this assessment (Figure 2). This mapping resource identified a wetland complex throughout the majority of the project site. This wetland was identified as palustrine, forested, seasonally flooded (PFOC); and palustrine, scrubshrub, seasonally flooded (PSSC) within the project site.

STATE OF WASHINGTON PRIORITY HABITATS AND SPECIES

The State of Washington *Priority Habitats and Species (PHS) Mapping* was reviewed as a part of this assessment (Figure 3). This mapping resource identified the same wetland areas within and adjacent to the project site as the *NWI Mapping* above.

STATE OF WASHINGTON DEPARTMENT OF FISH AND WILDLIFE

The State of Washington Department of Fish and Wildlife (WDFW) *SalmonScape Mapping* was reviewed as a part of this assessment (Figure 4). This mapping resource did not identify any drainage corridors within or adjacent to the project site. This mapping resource did identify a pond generally adjacent to the eastern boundary in the central portion of the project site.

STATE OF WASHINGTON DEPARTMENT OF NATURAL RESOURCES

The State of Washington Department of Natural Resources (WDNR) *Water Type Mapping* was reviewed as a part of this assessment (Figure 5). This mapping resource generally identified the same wetland noted in the NWI Mapping Resource above within the project site. This mapping resource further noted a pond adjacent to the eastern boundary as noted in the WDFW Mapping above. This mapping noted this pond as a Type F Water (fish-bearing).

CITY OF PUYALLUP MAPPING

The *City of Puyallup Inventory Mapping* was reviewed as a part of this assessment (Figure 6). This mapping resource generally identified the wetland noted in the other mapping

resources above within the project site and adjacent properties. This wetland was further identified as "field verified" by the City of Puyallup.

SOILS MAPPING

The *Soil Mapping Inventory* completed by the Natural Resources Conservation Service was reviewed as a part of this assessment (Figure 7). This mapping resource identified the soil throughout the majority of project site as Norma fine sandy loam (26A). The Norma soil series is defined as poorly drained; as formed in alluvium under sedges; and as listed as a "hydric" soil.

This mapping resource further noted the southern portion of the project site to contain Everett gravelly sandy loam (13B). The Everett soils series is defined as somewhat excessively drained, as formed in glacial outwash, and as not listed as "hydric" soil.

PRIOR ASSESSMENTS

Habitat Technologies had completed prior assessments for parcels within the surrounding area of the project site. These prior assessments had identified a wetland complex within the area. This wetland complex was ditched along the western boundary then entered a culvert within the Willow Springs Apartment complex. This drainage continued through a series of ditch lines, pipes, and culverts to eventually enter a Pierce County Storm Pond adjacent to 89th Avenue Court East (Figure 8). This storm pond did not appear to exhibit an outflow.

ONSITE ANALYSIS

CRITERIA FOR CRITICAL AREAS IDENTIFICATION

The City of Puyallup defines "critical areas" to include wetlands, fish and wildlife habitat areas, critical aquifer recharge areas, geologically hazardous areas, and frequently flooded areas. The critical areas assessment reported in this document has been limited to address wetlands and fish and wildlife habitat areas.

Wetlands: Wetlands are transitional areas between aquatic and upland habitats. In general terms, wetlands are lands where the extent and duration of saturation with water is the primary factor determining the nature of soil development and the types of plant and animal communities living in the soil and on its surface (Cowardin, et al., 1979). Wetlands are generally defined within land use regulations as "areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support,

and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" (US Army Corps of Engineers 1987).

Wetlands exhibit three essential characteristics, all of which must be present for an area to meet the established criteria (United States Army Corps of Engineers, 1987 and United States Army Corps of Engineers, 2010). These essential characteristics are:

- 1. Hydrophytic Vegetation: The assemblage of macrophytes that occurs in areas where inundation or soil saturation is either permanent or of sufficient frequency and duration to influence plant occurrence. Hydrophytic vegetation is present when the plant community is dominated by species that require or can tolerate prolonged inundation or soil saturation during the growing season.
- 2. Hydric Soil: A soil that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper parts. Most hydric soils exhibit characteristic morphologies that result from recent periods of saturation or inundation. These processes result in distinctive characteristics that persist in the soil during both wet and dry periods.
- **3. Wetland Hydrology:** Permanent or periodic inundation, or surface soil saturation, at least seasonally. Wetland hydrology indicators are used in combination with indicators of hydric soil and hydrophytic vegetation to define the area. Wetland hydrology indications provide evidence that the site has a continuing wetland hydrology regime. Where hydrology has not been altered vegetation and soils provide strong evidence that wetland hydrology is present.

Fish and Wildlife Habitat Areas: The City of Puyallup has defined "fish and wildlife habitat areas" to include those areas necessary for maintaining species in suitable habitats within their natural geographic distribution so that isolated subpopulations are not created as designated by WAC 365-190-080. These areas include:

- (a) Areas with which state or federally designated endangered, threatened, and sensitive species have a primary association;
- (b) Habitats of local importance, including but not limited to areas designated as priority habitat by the Department of Fish and Wildlife;
- (c) Streams and surface waters within the jurisdiction of the state of Washington; and
- (d) Land essential for preserving connections between habitats and open spaces.

STUDY METHODS

Habitat Technologies completed a series of onsite assessments from May through early-September 2018 and again in the late spring and summer of both 2019 and 2020. In addition, Habitat Technologies has completed similar critical areas assessments for the parcels associated with the project site as well as parcels located within the general area of the project site. The objective of this evaluation was to define and delineate potential critical areas (wetlands; drainage corridors; and fish and wildlife habitats) that may be present within or immediately adjacent to the project area. Onsite activities were completed in accordance with criteria and procedures established in the *Corps of Engineers Wetland Delineation Manual* (United States Army Corps of Engineers, 1987) with the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual* (United States Army Corps of Engineers, 2010); the Washington State *Wetland Rating System for Western Washington* (Hruby, 2014), the State of Washington Department of Natural Resources (WDNR) Forest Practice Rules (WAC 222-16-030), and the City of Puyallup Chapter 21.

FIELD OBSERVATION

The project site was accessed via 43rd Avenue SW that formed the southern boundary of the project site. The southern portion of the project site appeared to contain a historic fill pad that was overgrown with blackberries and contained a small "tent city" during the onsite assessments period. The southern project site was also heavily littered with garbage and debris from the onsite campers. The majority of the central and northern portion of the project sits was encumbered by a portion of a wetland complex within area parcels. Representative field data are provided in Appendix A.

• Plant Communities

As noted above the southern project site had been modified by the placement of historic fill and had become overrun with primarily Himalayan blackberry (*Rubus armeniacus*).

The plant community located directly to the north of the historic fill placement was dominated by species typically associated with seasonal saturation or seasonal shallow ponding. Observed species included black cottonwood (*Populus trichocarpa*), red alder (*Alnus rubra*), Western red cedar (*Thuja plicata*), Oregon ash (*Fraxinus latifolia*), Pacific willow (*Salix lasiandra*), Sitka willow (*Salix sitchensis*), crabapple (*Pyrus fusca*), Douglas spiraea (*Spiraea douglasii*), salmonberry (*Rubus spectabilis*), Himalayan blackberry (*Rubus armeniacus*), Pacific ninebark (*Physocarpus capitatus*), black twinberry (*Lonicera involucrata*), red osier dogwood (*Cornus stolonifera*), Nootka rose (*Rosa nutkana*), common lady fern (*Athyrium filix-femina*), deer fern (*Blechnum spicant*), maiden hair fern (*Adiantum pedatum*), cattail (*Typha latifolia*), skunk cabbage (*Lysichitum americanum*), small fruited bulrush (*Scirpus microcarpus*), slough sedge (*Carex obnupta*), water parsley (*Oenanthe sarmentosa*), speedwell (*Veronica scutellata*), buttercup (*Ranunculus repens*), curled dock (*Rumex crispus*), big leaf avens (*Geum macrophyllum*), reed canarygrass (*Phalaris arundinacea*), and reed mannagrass (*Glyceria grandis*). This plant community was identified as hydrophytic in character (i.e. typical of wetlands).

Along the western boundary the project site and adjacent parcel to the west a remnant upland forest community was noted. Observed species included Douglas fir (*Pseudotsuga menziesii*), Western red cedar (*Thuja plicata*), Western hemlock (*Tsuga heterophylla*), red alder (*Alnus rubra*), big leaf maple (*Acer macrophyllum*), cherry (*Prunus spp.*), Himalayan blackberry, evergreen blackberry (*Rubus laciniatus*), salal (*Gaultheria shallon*), Oregon grape (*Berberis nervosa*), holly (*Ilex aquifolium*), rose (*Rosa spp.*), Indian plum (*Oemleria cerasiformis*), Pacific red elderberry (*Sambucus racemosa*), salmonberry (*Rubus spectabilis*), Oceanspray (*Holodiscus discolor*), foam flower (*Tiarella trifoliata*), sword fern (*Polystichum munitum*), bracken fern (*Pteridium aquilium*), nettle (*Urtica dioica*), bluegrass (*Poa spp.*), daisy (*Bellis perennis*), clover (*Trifolium spp.*), bleeding heart (*Dicentra Formosa*), and buttercup. This plant community was identified as non-hydrophytic in character (i.e. typical of uplands).

• Hydrology

Onsite hydrology appeared to be the result of seasonal stormwater runoff from onsite, seasonal stormwater runoff from adjacent parcels and adjacent public roadways, and onsite soil characteristics. The southern portion (prior fill area) of the project site appeared to drain moderately well and did not exhibit field indicators typically associated with wetland hydrology.

The majority of the project site appeared to drain somewhat poorly to poorly. A portion of a wetland complex within the area dominated the area to the north of the southern prior fill area. As noted during prior assessments this wetland was ditched along the western boundary of the wetland offsite to the northwest. Seasonal hydrology from the wetland then entered a culvert within the Willow Springs apartment complex. This hydrology continued through a series of ditch lines, pipes, and culverts then eventually entered a Pierce County Storm Pond adjacent to 89th Avenue Court East.

• Soils

As noted above the project site had been modified by the historic prior placement of fill material in the southern portion of the project site. Within remnant upland areas the soil exhibited a gravelly sandy loam to gravelly loam texture and coloration typical of an Everett soil series. The surface soil typically exhibited a very dark grayish brown (10YR 3/2) coloration and a gravelly sandy loam to gravelly loam texture. The subsoil to a depth of approximately 20 inches also exhibited a dark brown (10YR 3/3) to brown (10YR 4/3) coloration, and gravelly sandy loam to gravelly loam texture. This soil was identified as non-hydric in character.

The soil identified throughout the majority of the project site exhibited a surface soil coloration of very dark grayish brown (10YR 3/2) to black (10YR 2/1). The subsoil varied

from black (10YR 2/1) to dark grayish brown (10YR 4/2) and exhibited prominent redoximorphic features (i.e. depleted matrix and redox concentrations). Oxidized root channels were also very evident. The soil ranged from gravelly loam, silt loam, to muck in texture. The soils within the majority of the project site exhibited field characteristics typical of hydric soil.

• Fish and Wildlife

Wildlife species observed or that would be reasonably expected to utilize the habitats provided within or adjacent to the project site would include red tailed hawk (Buteo jamaicensis), American crow (Corvus brachynchos), American robin (Turdus migratorius), black capped chickadee (Parus atricapillus), dark eyed junco (Junco hyemalis), rufous hummingbird (Selasphorus rufus), merlin (Falco columbarius), golden crowned sparrow (Zonotrichia atricapilla), mourning dove (Zenaida macroura), song sparrow (Melospiza melodia), white crowned sparrow (Zonotrichia leucophrys), house sparrow, house finch (Carpodacus mexicanus), starling (Sturnus vulgaris), American goldfinch (Carduelis tristis), purple finch (Carpodacus purpureus), violet green swallow (Tachycineta thallassina), tree swallow (Tachycineta bicolor), red winged blackbird (Agelaius phoenisues), brewer blackbird (Euphagus cyanocephalus), marsh wren (Cistothorus palustirs), great blue heron (Ardea herodias), common mallard (Anas platyrhynchos), Canada goose (Branta canadensis), northern flicker (Colaptes auratus), hairy woodpecker (Picoides villosus), black tailed deer (Odocoileus hemionus), raccoon (Procvon lotor), covote (Canis latrans), striped skunk (Mephitis mephitis), opossum (Didelphis virginianus), deer mouse (Peromyscus maniculatus), shrew (Sorex spp.), Townsend mole (Scapanus townsendii), voles (Microtus spp.), Norway rat (Rattus norvegicus), bats (Myotis spp.), eastern gray squirrel (Sciurus carolinensis), common garter snake (Thamnophis sirtalis), Pacific treefrog (Hyla regilla), and red legged frog (Rana aurora). The project site was not evaluated for the presence or absences of fish species since all seasonal drainage enters an offsite storm pond that appears to fully infiltrate.

Wildlife Movement Corridors: The project site was within a well urbanized area. As identified by onsite wildlife trials, small and medium sized mammals appeared to be moving throughout vacant parcels generally to the east and southeast of the project site. The project site is also within the general area of the migratory movement of waterfowl and passerine birds.

State Priority Species: Several species identified by the State of Washington as "Priority Species" were observed onsite or potentially may utilize the project site. Priority species require protective measures for their survival due to their population status, sensitivity to habitat alteration, and/or recreational, commercial, or tribal importance.

Game Species: "Game species" are regulated by the State of Washington through recreational hunting bag limits, harvest seasons, and harvest area

restrictions. Observed, documented, or reasonably expected "game species" within and adjacent to the project site included black tailed deer, mourning dove, common mallard, and Canada goose.

State Monitored: State Monitored species are native to Washington but require habitat that has limited availability, are indicators of environmental quality, require further assessment, have unresolved taxonomy, may be competing with other species of concern, or have significant popular appeal. Observed, documented, or reasonably expected "State Monitored" species within and adjacent to the project site included great blue heron.

State Candidate: State Candidate species are presently under review by the State of Washington Department of Fish and Wildlife (WDFW) for possible listing as endangered, threatened, or sensitive. No State Candidate species were observed or have been documented to use the habitats associated with the project site.

State Sensitive: State Sensitive species are native to Washington and is vulnerable to declining and is likely to become endangered or threatened throughout a significant portion of its range without cooperative management or removal of threats. No State Sensitive species were observed or have been documented to use the habitats associated with the project site.

State Threatened: State Threatened species means any wildlife species native to the state of Washington that is likely to become an endangered species within the foreseeable future throughout a significant portion of its range within the state without cooperative management or removal of threats. The project site did not appear and has not been documented to provide direct critical habitats for State Listed Threatened species.

State Endangered: State endangered species means any species native to the state of Washington that is seriously threatened with extinction throughout all or a significant portion of its range within the state. The project site did not appear and has not been documented to provide direct critical habitats for State Listed Endangered species.

Federally Listed Species: No federally listed endangered or threatened species were observed or have been documented to utilize the habitats provided by the project site. A single, federally listed "species of concern" – bald eagle – has been documented to utilize the habitats generally associated with the area lakes, ponds and the Puyallup River Corridor. However, the project site did not provide critical habitats for this species. This species may occasionally overfly the project site.

CRITICAL AREAS DETERMINATION

WETLANDS

Wetland determination was based on observations of hydrophytic vegetation, hydric soils, and wetland hydrology in accordance with the *Corps of Engineers Wetland Delineation Manual* (United States Army Corps of Engineers, 1987) with the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region* (United States Army Corps of Engineers, 2010). Based on these methods one (1) wetland area was identified to be associated with a topographic swale that dominated the project site.

WETLAND	CLASSIFICATION (USFWS)	CITY OF PUYALLUP CATEGORY	WDOE RATING SCORE	WDOE HABITAT SCORE
Α	PFOCd, PEMCd		18	5

Wetland A: Wetland A was identified throughout the majority of the project and to extend into adjacent parcels. Wetland A exhibited a mixed forest plant community within the project site. Offsite to the northwest this wetland exhibited an emergent plant community. Seasonal hydrology from the wetland entered a culvert within the Willow Springs apartment complex offsite to the northwest. This hydrology continued through a series of ditch lines, pipes, and culverts then eventually entered a Pierce County Stormwater Infiltration Pond adjacent to 89th Avenue Court East (Figure 8).

Wetland A met the U.S. Fish and Wildlife Service (USFWS) criteria for classification of palustrine, forested, seasonally flooded, ditched (PFOCd); and palustrine, emergent, seasonally flooded, ditched (PEMCd). Wetland A appeared to meet the criteria for designation as a City of Puyallup Category III Wetland and have an associated buffer of 60 feet for a moderate intensity land use. Wetland A achieved a total functions score of 18 points utilizing the Washington State Department of Ecology (WDOE) Wetland Rating Form for Western Washington (Hruby 2014) (Appendix B).

FISH AND WILDLIFE HABITAT AREAS

No areas were identified, or have been documented, with which state or federally designated endangered, threatened, and sensitive species have a primary association. In addition, no lands essential for preserving connections between habitats and open species were identified or previously documented.

The City of Puyallup Category III Wetland identified within the project site appears to meet the designation as a WDFW "priority habitat" and would be subject to the jurisdiction of the State of Washington.

SELECTED DEVELOPMENT ACTION

The Selected Development Action for the project site focuses on the future development of one duplex homesite within the project site (**Parcel 0419095003**). The development of this duplex would be completed without direct adverse impacts to the identified onsite City of Puyallup Category III Wetland or an encroachment into the associated standard wetland buffer (see Site Plan). A 10-foot building setback would also be established between the outer wetland buffer boundary and the proposed duplex.

STANDARD OF CARE

This document has been completed by Habitat Technologies for use by **Mr. David Artz**. Prior to extensive site planning the findings documented in this document should be reviewed and verified by the City of Puyallup. Habitat Technologies has provided professional services that are in accordance with the degree of care and skill generally accepted in the nature of the work accomplished. No other warranties are expressed or implied. Habitat Technologies is not responsible for design costs incurred before this document is approved by the appropriate resource and permitting agencies.

WETLAND DETERMINATION DATA FORM – Western Mountains, Valleys, and Coast Region

Project/Site: Artz Parcels		City/County: P	uyallup / Pierce	*****	Sampling Date:29 AUG 2018
Applicant/Owner:		Martin .	State: <u>V</u>	Vashington	Sampling Point: <u>SP-2</u>
Investigator(s): <u>Habitat Technologies</u>		Sec	tion, Township, Rai	nge: <u>S09, T19</u>	, R04E
Landform (hillslope, terrace, etc.):		Local relief (co	oncave, convex, no	ne):	Slope (%):
Subregion (LRR): <u>A</u>	Lat: _		Long:		Datum:
Soil Map Unit Name: Everett very grave	lly sandy loam			NWI classifica	tion:
Are climatic / hydrologic conditions on th	e site typical for this time of	fyear? Yes 🛛 🛛 N	lo 🔲 (If no, explain	in Remarks.)	
Are Vegetation, Soil, or Hy	/drology significantly	v disturbed?	Are "Normal Circum	istances" pres	sent? Yes 🛛 No 🗌
Are Vegetation, Soil, or Hy	/drology naturally pro	blematic? ((If needed, explain a	iny answers ir	n Remarks.)
SUMMARY OF FINDINGS - A	ttach site map showi	ng sampling p	oint locations,	transects,	important features, etc.
Hydrophytic Vegetation Present? Hydric Soil Present? Wetland Hydrology Present?	Yes 🗌 No 🖾	1	ampled Area I Wetland?	Yes 🗌 N	∘ ⊠
Remarks: Upland					

VEGETATION – Use scientific names of plants.

HGM Classification of Wetlands in Western Washington

For questions 1-7, the criteria described must apply to the entire unit being rated.

If the hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1-7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

NO – go to 2

YES – the wetland class is **Tidal Fringe** – go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

NO – Saltwater Tidal Fringe (Estuarine) *If your wetland can be classified as a Freshwater Tidal Fringe use the forms for Riverine wetlands. If it is Saltwater Tidal Fringe it is an* **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.

<u>NO – go to 3</u> If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.

3. Does the entire wetland unit meet all of the following criteria?
___The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
__At least 30% of the open water area is deeper than 6.6 ft (2 m).

NO – go to 4

YES - The wetland class is Lake Fringe (Lacustrine Fringe)

- 4. Does the entire wetland unit **meet all** of the following criteria?
 - _____The wetland is on a slope (*slope can be very gradual*),
 - The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks,
 - ____The water leaves the wetland **without being impounded**.

NO – go to 5

YES – The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

- 5. Does the entire wetland unit **meet all** of the following criteria?
 - ____The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
 - ____The overbank flooding occurs at least once every 2 years.

Wetland name or number _____

NO – go to 6 YES – The wetland class is **Riverine NOTE**: The Riverine unit can contain depressions that are filled with water when the river is not flooding

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

NO – go to 7

YES – The wetland class is Depressional

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

NO – go to 8

YES – The wetland class is Depressional

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream	Depressional
within boundary of depression	
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other	Treat as
class of freshwater wetland	ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.

WDFW Priority Habitats

<u>Priority habitats listed by WDFW</u> (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp. <u>http://wdfw.wa.gov/publications/00165/wdfw00165.pdf</u> or access the list from here: <u>http://wdfw.wa.gov/conservation/phs/list/</u>)

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** This question is independent of the land use between the wetland unit and the priority habitat.

- Aspen Stands: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- Herbaceous Balds: Variable size patches of grass and forbs on shallow soils over bedrock.
- ✓ Old-growth/Mature forests: <u>Old-growth west of Cascade crest</u> Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. <u>Mature forests</u> Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 see web link above*).
- **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 see web link above*).
- **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- Nearshore: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 6.5 ft (0.15 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- Snags and Logs: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

INTRODUCTION

This document details the culmination of activities and onsite evaluations undertaken to complete a critical areas assessment (i.e. wetlands, streams, fish and wildlife habitats) of **Parcel 0419095022 (project site).** The project site was located generally to the north of 43rd Avenue SW within the City of Puyallup, Pierce County, Washington (Figure 1). The evaluation and characterization of onsite and adjacent critical areas is a vital element in land use planning. The goal of this approach is to ensure that the proposed development of a single duplex and associated primary and reserve septic drainfield areas does not result in adverse environmental impacts to an identified City of Puyallup Category III Wetland and the associated 60-foot standard City of Puyallup buffer identified within the project site. As presently proposed, all development activities shall be accomplished without intrusion into the wetland or standard buffer areas.

The assessment and delineation of specific critical areas within and immediately adjacent to the project site followed the methods and procedures defined in the *Corps of Engineers Wetland Delineation Manual* (United States Army Corps of Engineers, 1987) with the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region* (United States Army Corps of Engineers, 2010); the Washington State *Wetland Rating System for Western Washington* (Hruby, 2014), the State of Washington Department of Natural Resources (WDNR) Forest Practice Rules (WAC 222-16-030), and the City of Puyallup Chapter 21. This document was designed to accommodate site planning and potential regulatory actions and is suitable for submittal to federal, state, and local authorities for potential critical areas verification and permitting actions.

PROJECT SITE DESCRIPTION

The project site was composed of an existing vacant parcel of record totaling approximately 1.26-acres in size. As outlined below the majority of the project site was encumbered by wetland and wetland buffers. The project site was located within an area of increasing urbanization focusing on more intense commercial retail and higher intensity residential development. The southern boundary of the project site was formed by 43rd Avenue SW. Existing multi-family residential development was identified to the east of the eastern boundary. Vacant land was present to the north and west.

Directions to Project Site: From Meridian Avenue East (southbound) turn west onto 43rd Avenue SW. Continue on 43rd Avenue SW to 409 - 43rd Avenue SW.

BACKGROUND INFORMATION

NATIONAL WETLAND INVENTORY

The National Wetland Inventory (NWI) Mapping completed by the U.S. Fish and Wildlife Service was reviewed as a part of this assessment (Figure 2). This mapping resource identified a wetland complex throughout the majority of the northwestern portion of the project site. This wetland site identified to continue offsite and was noted as palustrine, forested, seasonally flooded (PFOC); and palustrine, scrub-shrub, seasonally flooded (PSSC) within the project site.

STATE OF WASHINGTON PRIORITY HABITATS AND SPECIES

The State of Washington *Priority Habitats and Species (PHS) Mapping* was reviewed as a part of this assessment (Figure 3). This mapping resource identified the same wetland areas within and adjacent to the project site as the NWI Mapping above.

STATE OF WASHINGTON DEPARTMENT OF FISH AND WILDLIFE

The State of Washington Department of Fish and Wildlife (WDFW) SalmonScape Mapping was reviewed as a part of this assessment (Figure 4). This mapping resource did not identify any drainage corridors within or adjacent to the project site. This mapping resource did identify a pond generally adjacent to the eastern boundary in the central portion of the project site. This pond was not identified to provide habitats for salmonid fish species (genus Oncorhynchus).

STATE OF WASHINGTON DEPARTMENT OF NATURAL RESOURCES

The State of Washington Department of Natural Resources (WDNR) *Water Type Mapping* was reviewed as a part of this assessment (Figure 5). This mapping resource generally identified the same wetland noted in the NWI Mapping Resource above within the project site. This mapping resource further noted a pond adjacent to the eastern boundary as noted in the WDFW Mapping above. This mapping noted this offsite pond as a Type F Water (fish-bearing).

CITY OF PUYALLUP MAPPING

The *City of Puyallup Inventory Mapping* was reviewed as a part of this assessment (Figure 6). This mapping resource generally identified the wetland noted in the other mapping

resources above within the project site and adjacent properties. This wetland was further identified as "field verified" by the City of Puyallup.

PIERCE COUNTY MAPPING

The *Pierce County Mapping* was reviewed as a part of this assessment. This mapping resource identified that the Base Flood Plain Elevation (BFE) noted at 419.5 feet elevation floodplain did not extend onto the project site. The northern portion of the project site was noted as 424 feet elevation and the southern portion at 434 feet elevation.

SOILS MAPPING

The *Soil Mapping Inventory* completed by the Natural Resources Conservation Service was reviewed as a part of this assessment (Figure 7). This mapping resource identified the soil throughout the majority of project site as Norma fine sandy loam (26A). The Norma soil series is defined as poorly drained; as formed in alluvium under sedges; and as listed as a "hydric" soil.

This mapping resource further noted the southern portion of the project site to contain Everett gravelly sandy loam (13B). The Everett soils series is defined as somewhat excessively drained, as formed in glacial outwash, and as not listed as "hydric" soil.

PRIOR ASSESSMENTS

Habitat Technologies had completed prior assessments for parcels within the surrounding area of the project site. These prior assessments had identified a wetland complex within the area. This wetland complex was ditched along the western boundary then entered a culvert within the Willow Springs Apartment complex. This drainage continued through a series of ditch lines, pipes, and culverts to eventually enter a Pierce County Storm Pond adjacent to 89th Avenue Court East. This storm pond did not appear to exhibit an outflow.

ONSITE ANALYSIS

CRITERIA FOR CRITICAL AREAS IDENTIFICATION

The City of Puyallup defines "critical areas" to include wetlands, fish and wildlife habitat areas, critical aquifer recharge areas, geologically hazardous areas, and frequently flooded areas. The critical areas assessment reported in this document has been limited to address wetlands, surface water drainages, and fish and wildlife habitat areas.

Wetlands: Wetlands are transitional areas between aquatic and upland habitats. In general terms, wetlands are lands where the extent and duration of saturation with water is the primary factor determining the nature of soil development and the types of plant and animal communities living in the soil and on its surface (Cowardin, et al., 1979). Wetlands are generally defined within land use regulations as "areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" (US Army Corps of Engineers 1987).

Wetlands exhibit three essential characteristics, all of which must be present for an area to meet the established criteria (United States Army Corps of Engineers, 1987 and United States Army Corps of Engineers, 2010). These essential characteristics are:

- 1. Hydrophytic Vegetation: The assemblage of macrophytes that occurs in areas where inundation or soil saturation is either permanent or of sufficient frequency and duration to influence plant occurrence. Hydrophytic vegetation is present when the plant community is dominated by species that require or can tolerate prolonged inundation or soil saturation during the growing season.
- 2. Hydric Soil: A soil that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper parts. Most hydric soils exhibit characteristic morphologies that result from recent periods of saturation or inundation. These processes result in distinctive characteristics that persist in the soil during both wet and dry periods.
- **3. Wetland Hydrology:** Permanent or periodic inundation, or surface soil saturation, at least seasonally. Wetland hydrology indicators are used in combination with indicators of hydric soil and hydrophytic vegetation to define the area. Wetland hydrology indications provide evidence that the site has a continuing wetland hydrology regime. Where hydrology has not been altered vegetation and soils provide strong evidence that wetland hydrology is present.

Fish and Wildlife Habitat Areas: The City of Puyallup has defined "fish and wildlife habitat areas" to include those areas necessary for maintaining species in suitable habitats within their natural geographic distribution so that isolated subpopulations are not created as designated by WAC 365-190-080. These areas include:

- (a) Areas with which state or federally designated endangered, threatened, and sensitive species have a primary association;
- (b) Habitats of local importance, including but not limited to areas designated as priority habitat by the Department of Fish and Wildlife;
- (c) Streams and surface waters within the jurisdiction of the state of Washington; and
- (d) Land essential for preserving connections between habitats and open spaces.

STUDY METHODS

Habitat Technologies completed a series of onsite assessments from May 2018 through December 2019 and then again during the summer and early fall of 2020. In addition, Habitat Technologies has completed similar critical areas assessments for the parcels associated with the project site as well as parcels located within the general area of the project site. The objective of this evaluation was to define and delineate potential critical areas (wetlands; drainage corridors; and fish and wildlife habitats) that may be present within or immediately adjacent to the project area. Onsite activities were completed in accordance with criteria and procedures established in the *Corps of Engineers Wetland Delineation Manual* (United States Army Corps of Engineers, 1987) with the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region* (United States Army Corps of Engineers, 2010); the Washington State *Wetland Rating System for Western Washington* (Hruby, 2014), the State of Washington Department of Natural Resources (WDNR) Forest Practice Rules (WAC 222-16-030), and the City of Puyallup Chapter 21.

FIELD OBSERVATION

The project site was accessed via 43rd Avenue SW that formed the southern boundary of the project site. The southern portion of the project site appeared to contain a historic fill pad that was overgrown with blackberries and contained a small "tent city" during the onsite assessments period. The southern portion of the project site was also heavily littered with garbage and debris from the onsite campers. The majority of the central and northern portions of the project site were encumbered by a portion of a wetland complex that extended onto adjacent parcels. Representative field data are provided in Appendix A.

• Plant Communities

As noted above the southern project site had been modified by the placement of historic fill and had become overrun with primarily Himalayan blackberry (*Rubus armeniacus*).

The plant community located directly to the north of the historic fill placement was dominated by species typically associated with seasonal saturation or seasonal shallow ponding. Observed species included black cottonwood (*Populus trichocarpa*), red alder (*Alnus rubra*), Western red cedar (*Thuja plicata*), Oregon ash (*Fraxinus latifolia*), Pacific willow (*Salix lasiandra*), Sitka willow (*Salix sitchensis*), crabapple (*Pyrus fusca*), Douglas spiraea (*Spiraea douglasii*), salmonberry (*Rubus spectabilis*), Himalayan blackberry (*Rubus armeniacus*), Pacific ninebark (*Physocarpus capitatus*), black twinberry (*Lonicera involucrata*), red osier dogwood (*Cornus stolonifera*), Nootka rose (*Rosa nutkana*),

common lady fern (*Athyrium filix-femina*), deer fern (*Blechnum spicant*), maiden hair fern (*Adiantum pedatum*), cattail (*Typha latifolia*), skunk cabbage (*Lysichitum americanum*), small fruited bulrush (*Scirpus microcarpus*), slough sedge (*Carex obnupta*), water parsley (*Oenanthe sarmentosa*), speedwell (*Veronica scutellata*), buttercup (*Ranunculus repens*), curled dock (*Rumex crispus*), big leaf avens (*Geum macrophyllum*), reed canarygrass (*Phalaris arundinacea*), and reed mannagrass (*Glyceria grandis*). This plant community was identified as hydrophytic in character (i.e. typical of wetlands).

The eastern boundary the project site exhibited scattered areas of remnant upland forest community. Observed species included Douglas fir (*Pseudotsuga menziesii*), Western red cedar (*Thuja plicata*), Western hemlock (*Tsuga heterophylla*), red alder (*Alnus rubra*), big leaf maple (*Acer macrophyllum*), cherry (*Prunus spp.*), Himalayan blackberry, evergreen blackberry (*Rubus laciniatus*), salal (*Gaultheria shallon*), Oregon grape (*Berberis nervosa*), holly (*Ilex aquifolium*), rose (*Rosa spp.*), Indian plum (*Oemleria cerasiformis*), Pacific red elderberry (*Sambucus racemosa*), salmonberry (*Rubus spectabilis*), Oceanspray (*Holodiscus discolor*), foam flower (*Tiarella trifoliata*), sword fern (*Polystichum munitum*), bracken fern (*Pteridium aquilium*), nettle (*Urtica dioica*), bluegrass (*Poa spp.*), daisy (*Bellis perennis*), clover (*Trifolium* spp.), bleeding heart (*Dicentra Formosa*), and buttercup. This plant community was identified as non-hydrophytic in character (i.e. typical of uplands).

Hydrology Patterns

Onsite hydrology appeared to be the result of seasonal stormwater runoff from onsite, seasonal stormwater runoff from adjacent parcels, public roadways, and onsite soils. The southern portion (prior fill area) of the project site appeared to drain moderately well and did not exhibit field indicators typically associated with wetland hydrology.

The majority of the project site appeared to drain somewhat poorly to poorly. A portion of a wetland complex within the area dominated the western portion of the project site to the north of the southern prior fill area. As noted during prior assessments this wetland was ditched along the western boundary of the wetland offsite to the northwest. Seasonal hydrology from the wetland then entered a culvert within the Willow Springs Apartment Complex. This hydrology continued through a series of ditch lines, pipes, and culverts to eventually enter a Pierce County Storm Pond adjacent to 89th Avenue Court East. This storm pond did not appear to exhibit an outflow.

• Soils

As noted above the project site had been modified by the historic prior placement of fill material in the southern portion of the project site. Within remnant upland areas the soil exhibited a gravelly sandy loam to gravelly loam texture and coloration typical of an Everett soil series. The surface soil typically exhibited a very dark grayish brown (10YR

3/2) coloration and a gravelly sandy loam to gravelly loam texture. The subsoil to a depth of approximately 20 inches also exhibited a dark brown (10YR 3/3) to brown (10YR 4/3) coloration, and gravelly sandy loam to gravelly loam texture. This soil was identified as non-hydric in character.

The soil identified within the northwestern portion of the project site exhibited a surface soil coloration of very dark grayish brown (10YR 3/2) to black (10YR 2/1). The subsoil varied from black (10YR 2/1) to dark grayish brown (10YR 4/2) and exhibited prominent redoximorphic features (i.e. depleted matrix and redox concentrations). Oxidized root channels were also very evident. The soil ranged from gravelly loam, silt loam, to muck in texture. The soils within the majority of the project site exhibited field characteristics typical of a hydric soil.

• Fish and Wildlife

Wildlife species observed or that would be reasonably expected to utilize the habitats provided within or adjacent to the project site would include red tailed hawk (Buteo iamaicensis), American crow (Corvus brachynchos), American robin (Turdus migratorius), black capped chickadee (Parus atricapillus), dark eyed junco (Junco hyemalis), rufous hummingbird (Selasphorus rufus), merlin (Falco columbarius), golden crowned sparrow (Zonotrichia atricapilla), mourning dove (Zenaida macroura), song sparrow (Melospiza melodia), white crowned sparrow (Zonotrichia leucophrys), house sparrow, house finch (Carpodacus mexicanus), starling (Sturnus vulgaris), American goldfinch (Carduelis tristis), purple finch (Carpodacus purpureus), violet green swallow (Tachycineta thallassina), tree swallow (Tachycineta bicolor), red winged blackbird (Agelaius phoenisues), brewer blackbird (Euphagus cyanocephalus), marsh wren (Cistothorus palustirs), great blue heron (Ardea herodias), common mallard (Anas platyrhynchos), Canada goose (Branta canadensis), northern flicker (Colaptes auratus), hairy woodpecker (Picoides villosus), black tailed deer (Odocoileus hemionus), raccoon (Procyon lotor), coyote (Canis latrans), striped skunk (Mephitis mephitis), opossum (Didelphis virginianus), deer mouse (Peromyscus maniculatus), shrew (Sorex spp.), Townsend mole (Scapanus townsendii), voles (Microtus spp.), Norway rat (Rattus norvegicus), bats (Myotis spp.), eastern gray squirrel (Sciurus carolinensis), common garter snake (Thamnophis sirtalis), Pacific treefrog (Hyla regilla), and red legged frog (Rana aurora).

The project site did not appear to provide and has not been documented to provide habitats for fish species. Surface water from the project site was also identified to enter an offsite, isolated Pierce County stormwater system.

Wildlife Movement Corridors: The project site was within a well urbanized area. As identified by onsite wildlife trials, small and medium sized mammals appeared to be moving throughout vacant parcels generally to the east and southeast of the project site.

The project site is also within the general area of the migratory movement of waterfowl and passerine birds.

State Priority Species: Several species identified by the State of Washington as "Priority Species" were observed onsite or potentially may utilize the project site. Priority species require protective measures for their survival due to their population status, sensitivity to habitat alteration, and/or recreational, commercial, or tribal importance.

Game Species: "Game species" are regulated by the State of Washington through recreational hunting bag limits, harvest seasons, and harvest area restrictions. Observed, documented, or reasonably expected "game species" within and adjacent to the project site included black tailed deer, mourning dove, common mallard, and Canada goose.

State Monitored: State Monitored species are native to Washington but require habitat that has limited availability, are indicators of environmental quality, require further assessment, have unresolved taxonomy, may be competing with other species of concern, or have significant popular appeal. Observed, documented, or reasonably expected "State Monitored" species within and adjacent to the project site included great blue heron.

State Candidate: State Candidate species are presently under review by the State of Washington Department of Fish and Wildlife (WDFW) for possible listing as endangered, threatened, or sensitive. No State Candidate species were observed or have been documented to use the habitats associated with the project site.

State Sensitive: State Sensitive species are native to Washington and is vulnerable to declining and is likely to become endangered or threatened throughout a significant portion of its range without cooperative management or removal of threats. No State Sensitive species were observed or have been documented to use the habitats associated with the project site.

State Threatened: State Threatened species means any wildlife species native to the state of Washington that is likely to become an endangered species within the foreseeable future throughout a significant portion of its range within the state without cooperative management or removal of threats. The project site did not appear and has not been documented to provide direct critical habitats for State Listed Threatened species.

State Endangered: State endangered species means any species native to the state of Washington that is seriously threatened with extinction throughout all or a significant portion of its range within the state. The project site did not appear and has not been documented to provide direct critical habitats for State Listed Endangered species.

Federally Listed Species: No federally listed endangered or threatened species were observed or have been documented to utilize the habitats provided by the project site. A single, federally listed "species of concern" – bald eagle – has been documented to utilize the habitats generally associated with the area lakes, ponds and the Puyallup River Corridor. However, the project site did not provide critical habitats for this species. This species may occasionally overfly the project site.

CRITICAL AREAS DETERMINATION

WETLANDS

Wetland determination was based on observations of hydrophytic vegetation, hydric soils, and wetland hydrology in accordance with the *Corps of Engineers Wetland Delineation Manual* (United States Army Corps of Engineers, 1987) with the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region* (United States Army Corps of Engineers, 2010). Based on these methods one (1) wetland area was identified to be associated with a topographic swale that dominated the northwestern portion of the project site.

WETLAND	CLASSIFICATION	CITY OF PUYALLUP	WDOE RATING	WDOE HABITAT
	(USFWS)	CATEGORY	SCORE	SCORE
Α	PFOCd, PEMCd		18	5

Wetland A: Wetland A was identified throughout the majority of the northwestern portion of the project site and to extend into adjacent parcels. Onsite Wetland A exhibited a mixed forest plant community. Offsite to the northwest this wetland also exhibited an emergent plant community. Seasonal hydrology from the wetland entered a culvert within the Willow Springs apartment complex offsite to the northwest. This hydrology continued through a series of ditch lines, pipes, and culverts then eventually entered a Pierce County storm pond adjacent to 89th Avenue Court East (Figure 8). This storm pond did not appear to exhibit an outflow. As such, Wetland A was identified within an isolated basin and not hydrologically connected by an above ground pathway to any downstream aquatic resources.

Wetland A met the U.S. Fish and Wildlife Service (USFWS) criteria for classification of palustrine, forested, seasonally flooded, ditched (PFOCd); and palustrine, emergent, seasonally flooded, ditched (PEMCd). Wetland A appeared to meet the criteria for designation as a City of Puyallup Category III Wetland and have an associated buffer of 60 feet in width for a moderate intensity land use. Wetland A achieved a total functions score of 18 points utilizing the Washington State Department of Ecology (WDOE) *Wetland Rating Form for Western Washington* (Appendix B).

FISH AND WILDLIFE HABITAT AREAS

No areas were identified, or have been documented, with which state or federally designated endangered, threatened, and sensitive species have a primary association. In addition, no lands essential for preserving connections between habitats and open species were identified or previously documented. The City of Puyallup Category III Wetland identified within the project site appeared to meet the designation as a WDFW "priority habitat" and would be potentially subject to the jurisdiction of the State of Washington.

SELECTED DEVELOPMENT ACTION

The Selected Development Action for the project site focuses on the development of a single duplex within the southern portion of the project site and the associated septic drainfield (primary and reserve) along the central-eastern boundary of the project site (Parcel 0419095022). The development of this duplex would be completed without direct adverse impacts to the identified onsite City of Puyallup Category III Wetland or any encroachment into the associated standard wetland buffer (see Site Plan).

STANDARD OF CARE

This document has been completed by Habitat Technologies for use by **Mr. David Artz**. Prior to extensive site planning the findings documented in this document should be reviewed and verified by the City of Puyallup. Habitat Technologies has provided professional services that are in accordance with the degree of care and skill generally accepted in the nature of the work accomplished. No other warranties are expressed or implied. Habitat Technologies is not responsible for design costs incurred before this document is approved by the appropriate resource and permitting agencies.

APPENDIX A – Representative Field Data

N

.

WDFW Priority Habitats

<u>Priority habitats listed by WDFW</u> (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp. <u>http://wdfw.wa.gov/publications/00165/wdfw00165.pdf</u> or access the list from here: <u>http://wdfw.wa.gov/conservation/phs/list/</u>)

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** This question is independent of the land use between the wetland unit and the priority habitat.

- Aspen Stands: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- Herbaceous Balds: Variable size patches of grass and forbs on shallow soils over bedrock.
- X **Old-growth/Mature forests:** <u>Old-growth west of Cascade crest</u> Stands of at least 2 tree species, forming a multilayered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. <u>Mature forests</u> – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- Oregon White Oak: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 see web link above*).
- **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 see web link above*).
- Instream: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- Nearshore: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page*).
- **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 6.5 ft (0.15 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- Snags and Logs: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

Wetland Rating System for Western WA: 2014 Update Rating Form – Effective January 1, 2015

HGM Classification of Wetlands in Western Washington

For questions 1-7, the criteria described must apply to the entire unit being rated.

If the hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1-7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

NO – go to 2

YES – the wetland class is **Tidal Fringe** – go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

NO – Saltwater Tidal Fringe (Estuarine)

YES - Freshwater Tidal Fringe If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands. If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.

NO – go to 3 **YES** – The wetland class is **Flats** *If your wetland can be classified as a Flats wetland, use the form for Depressional wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria? ____The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size; ____At least 30% of the open water area is deeper than 6.6 ft (2 m).

NO – go to 4

YES – The wetland class is **Lake Fringe** (Lacustrine Fringe)

- 4. Does the entire wetland unit **meet all** of the following criteria? _____The wetland is on a slope (*slope can be very gradual*),
 - _____The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks,
 - _The water leaves the wetland **without being impounded**.

NO – go to 5

YES – The wetland class is **Slope**

NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

- 5. Does the entire wetland unit **meet all** of the following criteria?
 - ____The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river.
 - _____The overbank flooding occurs at least once every 2 years.

Wetland name or number <u>A</u>

NO – go to 6 YES – The wetland class is **Riverine NOTE**: The Riverine unit can contain depressions that are filled with water when the river is not flooding

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

NO – go to 7

YES – The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

NO – go to 8

YES – The wetland class is Depressional

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream	Depressional
within boundary of depression	
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other	Treat as
class of freshwater wetland	ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have **more than 2 HGM classes** within a wetland boundary, classify the wetland as Depressional for the rating.

DEPRESSIONAL AND FLATS WETLANDS Water Quality Functions - Indicators that the site functions to improve water quality	
D 1.0. Does the site have the potential to improve water quality?	
D 1.1. Characteristics of surface water outflows from the wetland:	
Wetland is a depression or flat depression (QUESTION 7 on key) with no surface water leaving it (no outlet). points = 3	
Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet. points = 2	2
Wetland has an unconstricted, or slightly constricted, surface outlet that is permanently flowing points = 1 Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch. points = 1	
D 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions). Yes = 4 No = 0	0
D 1.3. Characteristics and distribution of persistent plants (Emergent, Scrub-shrub, and/or Forested Cowardin classes): Wetland has persistent, ungrazed, plants > 95% of area points = 5 Wetland has persistent, ungrazed, plants > ½ of area points = 3 Wetland has persistent, ungrazed plants > ¹ / ₁₀ of area points = 1 Wetland has persistent, ungrazed plants < ¹ / ₁₀ of area points = 0	3
D 1.4. Characteristics of seasonal ponding or inundation:This is the area that is ponded for at least 2 months. See description in manual.Area seasonally ponded is > ½ total area of wetlandArea seasonally ponded is > ½ total area of wetlandArea seasonally ponded is > ¼ total area of wetlandArea seasonally ponded is < ¼ total area of wetland	2
Total for D 1Add the points in the boxes above	7

Rating of Site Potential If score is: $12-16 = H \times 6-11 = M = 0-5 = L$ Record the rating on the first page

D 2.0. Does the landscape have the potential to support the water quality function of the site?	
D 2.1. Does the wetland unit receive stormwater discharges? Yes = 1 No = 0	1
D 2.2. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants? Yes = 1 No = 0	1
D 2.3. Are there septic systems within 250 ft of the wetland? Yes = 1 No = 0	1
D 2.4. Are there other sources of pollutants coming into the wetland that are not listed in questions D 2.1-D 2.3? SourceYes = 1 No = 0	0
Total for D 2Add the points in the boxes above	3

Rating of Landscape Potential If score is: X 3 or 4 = H 1 or 2 = M 0 = L Record the rating on the first page

D 3.0. Is the water quality improvement provided by the site valuable to society?		
D 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river 303(d) list?	r, lake, or marine water that is on the Yes = 1 No = 0	0
D 3.2. Is the wetland in a basin or sub-basin where an aquatic resource is on t	the 303(d) list? Yes = 1 No = 0	0
D 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality (<i>answer YES if there is a TMDL for the basin in which the unit is found</i>)? Yes = 2 No = 0		0
Total for D 3	Add the points in the boxes above	0
Rating of Value If score is: $2-4 = H$ $1 = M$ $X_0 = L$	Record the rating on the first page	-

١

DEPRESSIONAL AND FLATS WETLANDS Hydrologic Functions - Indicators that the site functions to reduce flood		on
D 4.0. Does the site have the potential to reduce flooding and erosion?	0	
O 4.1. <u>Characteristics of surface water outflows from the wetland</u> : Wetland is a depression or flat depression with no surface water leaving it (no outlet) Wetland has an intermittently flowing stream or ditch, OR highly constricted permane Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flow Wetland has an unconstricted, or slightly constricted, surface outlet that is permanent	ing ditch points = 1	2
D 4.2. Depth of storage during wet periods: Estimate the height of ponding above the botton with no outlet, measure from the surface of permanent water or if dry, the deepest particles of ponding are 3 ft or more above the surface or bottom of outlet Marks of ponding between 2 ft to < 3 ft from surface or bottom of outlet Marks are at least 0.5 ft to < 2 ft from surface or bottom of outlet The wetland is a "headwater" wetland Wetland is flat but has small depressions on the surface that trap water Marks of ponding less than 0.5 ft (6 in)	-	3
D 4.3. <u>Contribution of the wetland to storage in the watershed</u> : <i>Estimate the ratio of the area contributing surface water to the wetland to the area of the wetland unit itself.</i> The area of the basin is less than 10 times the area of the unit The area of the basin is 10 to 100 times the area of the unit The area of the basin is more than 100 times the area of the unit Entire wetland is in the Flats class	points = 5 points = 3 points = 0 points = 5	5
	ints in the boxes above	10
Rating of Site Potential If score is: 12-16 = H X 6-11 = M 0-5 = L	Record the rating on the j	first pa
0 5.0. Does the landscape have the potential to support hydrologic functions of the		
5.1. Does the wetland receive stormwater discharges?	Yes = 1 No = 0	1
0 5.2. Is >10% of the area within 150 ft of the wetland in land uses that generate excess run	off? Yes = 1 No = 0	1
5.3. Is more than 25% of the contributing basin of the wetland covered with intensive hum >1 residence/ac, urban, commercial, agriculture, etc.)?	an land uses (residential at Yes = 1 No = 0	1
Total for D 5 Add the po	ints in the boxes above	3
Rating of Landscape Potential If score is: X_3 = H1 or 2 = M0 = L	Record the rating on the j	first pa
0 6.0. Are the hydrologic functions provided by the site valuable to society?		
 D 6.1. <u>The unit is in a landscape that has flooding problems</u>. <i>Choose the description that best the wetland unit being rated. Do not add points. <u>Choose the highest score if more than</u> The wetland captures surface water that would otherwise flow down-gradient into are damaged human or natural resources (e.g., houses or salmon redds):</i> Flooding occurs in a sub-basin that is immediately down-gradient of unit. Surface flooding problems are in a sub-basin farther down-gradient. Flooding from groundwater is an issue in the sub-basin. 	<u>n one condition is met</u> . eas where flooding has points = 2 points = 1 points = 1	1
The existing or potential outflow from the wetland is so constrained by human or natu water stored by the wetland cannot reach areas that flood. <i>Explain why</i>	points = 0	
	points = 0	
There are no problems with flooding downstream of the wetland.		
6.2. Has the site been identified as important for flood storage or flood conveyance in a reg	gional flood control plan? Yes = 2 No = 0	0

Wetland name or number <u>A</u>

ş

These ques	tions apply to wetlands	of all HGM classes.	
HABITAT FUNCTIONS - Indicators that	site functions to provide	e important habitat	
H 1.0. Does the site have the potential to p	provide habitat?		
H 1.1. Structure of plant community: Indicators Cowardin plant classes in the wetland. U of ¼ ac or more than 10% of the unit if it Aquatic bed Emergent Scrub-shrub (areas where shrubs ha XForested (areas where trees have > If the unit has a Forested class, che XThe Forested class has 3 out of 5 str that each cover 20% within the For	p to 10 patches may be comb is smaller than 2.5 ac. Add th ave > 30% cover) 30% cover) ck if: rata (canopy, sub-canopy, shr	ined for each class to meet the threshold e number of structures checked. 4 structures or more: points = 4 3 structures: points = 2 2 structures: points = 1 1 structure: points = 0	2
H 1.2. Hydroperiods Check the types of water regimes (hydromore than 10% of the wetland or ¼ ac to <u>x</u> Permanently flooded or inundated <u>X</u> Seasonally flooded or inundated <u>X</u> Saturated only Permanently flowing stream or river <u>X</u> Seasonally flowing stream in, or adjunct Lake Fringe wetland Freshwater tidal wetland	periods) present within the w count (<i>see text for descriptio</i> r in, or adjacent to, the wetla	ns of hydroperiods). 4 or more types present: points = 3 3 types present: points = 2 2 types present: points = 1 1 type present: points = 0	3
H 1.3. Richness of plant species Count the number of plant species in the Different patches of the same species can the species. Do not include Eurasian m If you counted: > 19 species 5 - 19 species < 5 species	n be combined to meet the siz	e threshold and you do not have to name	2
H 1.4. Interspersion of habitats Decide from the diagrams below whether the classes and unvegetated areas (can in have four or more plant classes or three of	nclude open water or mudflat	din plants classes (described in H 1.1), or s) is high, moderate, low, or none. <i>If you</i>	1

÷.

I for H 1 Add the points in the boxes above	11
permanently or seasonally inundated <i>(structures for egg-laying by amphibians)</i> Invasive plants cover less than 25% of the wetland area in every stratum of plants (<i>see H 1.1 for list of strata</i>)	
\underline{X} At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are	
Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (cut shrubs or trees that have not yet weathered where wood is exposed)	3
Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m)	
_xStanding snags (dbh > 4 in) within the wetland	
$X_{\rm Large}$, downed, woody debris within the wetland (> 4 in diameter and 6 ft long).	
Check the habitat features that are present in the wetland. The number of checks is the number of points.	
5. Special habitat features:	

Rating of Site Potential If score is: ____15-18 = H \times ___7-14 = M ___0-6 = L

Introduction

It is the intent of this letter to presence site and soil characteristics with regard to potential critical areas which may exist on the above-mentioned property. Site conditions and evaluation are required to support on-site septic designs prepared for two of the three parcels. Site observations, subsurface soil observations and research conducted for the three lots and specifically the two southern parcels found no critical areas as defined by the City of Puyallup ordinance. The soil and site conditions are considered consistent with the development proposed.

Project Description

A landslide hazard report is necessary to satisfy the City of Puyallup's Municipal Code requirements relating to building activities in the area of qualifying slopes. Specifically, the applicant intends to complete a remodel and deck addition on an existing single-family home which is located near slopes meeting the criteria for report submission. We understand that these improvements are planned on the nearly level portion of the site, although all slopes will be evaluated relative to the City's ordinance.

Per Puyallup Municipal Code 21.06.1210(3)(ii); a geotechnical report is required if all three of the following characteristics are met:

- A. Slopes steeper than 15%
- B. Hillsides intersecting geologic contacts with a relatively permeable sediment overlying a relatively impermeable sediment or bedrock; and
- C. Springs or groundwater seepage

As part of this assessment we made observations of adjacent slopes for the presence of landslide hazard indicators. We also reviewed available published soil and geological records, aerial photography, topographical maps, and LiDAR terrain maps to help gain an understanding of the area morphology and establish an opinion on slope morphology and stability.

Information Sources

The regulatory standard for this assessment is outlined in the City of Puyallup Municipal Code, Chapter 21.06.1210-70. Soil identification and mapping for this assessment is supported by information from the Natural Resource Conservation Service (the Survey), and on-site soil evaluation performed during the wastewater system design phase as documented in the Tacoma-Pierce County Health Department records. Geologic information for this assessment is supported by information from the United States Geological Survey (USGS) *Draft* Geologic Map Geologic Map of the Puyallup 7.5 Minute Quadrangle. Our understanding of slope morphology is supported by the review of published topographic and relief map layers from the Pierce County Geographical Information System (GIS). Our slope stability opinions

David Artz Site Evaluation January 29, 2020 Page 2 of 7 are based on our interpretation of the cumulative information and the contemporary conditions of the geologic setting.

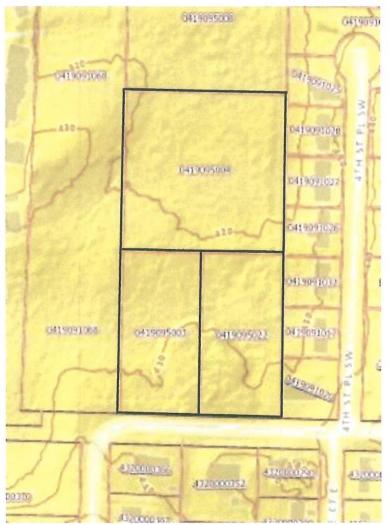

Published Information Accuracy

It should be noted that the Survey, the USGS and/or DNR geologic maps, and the Pierce County GIS define general areas of soil deposits, geology, and landforms. Given the large areas to identify and limited sample points, the authors of the above sources had to infer boundaries, contacts, and other representations in some areas. Only through on site reconnaissance can we further detail and adjust information from the maps as they relate to each site. They are not (from our experience) accurate on a lot by lot basis in all cases. In this case, the Survey, the DNR unit identification, and the published soil logs are generally in concurrence.

Site Description

General

The project involves of three parcels located north of 43rd AV SW (116th ST E) between 4th ST PL SW and 98th AV E on South Hill, Puyallup. The two southern lots are currently being developed; the northern lot will not be developed at this time. The two southern parcels are 54,450 sf each (1.25 ac.) and the

northern parcel is 109,336 sf (2.51 ac). The vacant land is covered with berry vines and a few hardwood and conifer trees. Topographically the surface of the three lots is best described as nearly level with a rolling surface descending gently to the northeast and northwest. There are isolated areas with short moderate slopes with grades measured in the field of less than 5%.

Development plans involve the southern portion of the two southern lots for residential housing. The development will be supported by onsite septic systems designed for the type of structure and soil textures, municipal water and on-site storm water control.

Soil

As discussed in the 'Published Information Accuracy' section above, on-site reconnaissance is necessary to verify soil conditions on specific properties. The NRCS identifies the soil on the two southern lots as Everett gravelly sandy loam (13B) In this case; test pits excavated north and east of the proposed structure as a

portion of the wastewater permitting phase confirmed soil typical of Everett gravelly sandy loamy.

David Artz Site Evaluation January 29, 2020 Page 3 of 7

Everett 13B – Everett gravelly sandy loam, 0 – 6 percent slopes

This rolling soil is somewhat excessively drained. It formed in gravelly glacial outwash under conifers. The typical elevation range for this soil is from 200 to 700 feet. Included with this soil in mapping are about eight percent Alderwood soils. Also included are some areas that are as much as five percent sandy Indianola soils and ten percent gravelly Neilton soils and less sloping Everett soils. In a typical profile the surface layer is very dark brown gravelly sandy loam about two inches thick. The subsoil, between depths of two and 19 inches, is dark yellowish brown gravelly sandy loam and dark brown very gravelly coarse sandy loam. The substratum, between depths of 19 and more than 60 inches, is clean, loose very gravelly sand.

Permeability is rapid. The available water capacity is low. Surface runoff is slow, and the erosion hazard is low. The effective rooting depth is more than four feet.

This nearly level to undulating soil is somewhat excessively drained. It formed in gravelly glacial outwash under conifers. Elevation ranges from 200 to 700 feet. The annual precipitation is 35 to 45 inches, and the mean annual air temperature is about 50 degrees F. The frost-free season is about 180 days. Most areas of this soil are gently sloping, but some places are broken by steep slopes 15 to 70 feet long.

Included with this soil in mapping are ten percent Neilton gravelly loamy sand and less than 10 percent Alderwood and sandy Indianola soils.

In a typical profile the surface layer is very dark brown gravelly sandy loam about two inches thick. The subsoil, between depths of two and 19 inches, is dark yellowish brown gravelly sandy loam and dark brown very gravelly coarse sandy loam. The substratum, between depths of 10 and more than 60 inches, is clean loose very gravelly sand. Reaction is medium acid.

Permeability is rapid. The available water capacity is low. Surface runoff is slow, and there is little or no erosion hazard. The effective rooting depth is more than four feet.

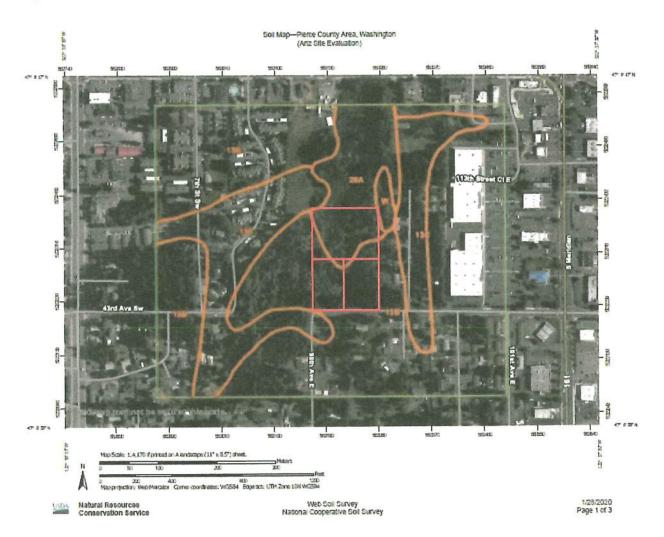

Large areas of this soil are under native vegetation, but they are being rapidly urbanized. This soil is among the least desirable in the area for farming, but it is one of the most desirable for and home sites and as a source of gravel for construction purposes. There are no limitations for urban development. However, septic waste from drain fields endanger ground water supplies because the soil is rapidly permeable.

NRCS Soil Map

	Map Unit Symbol	Hap Linit Name	Acres In AOI	Percent of ACI	
138		Everal2 very gravely sandy costs, u to 6 percent wopes	49.2		67 676

Totals	for Area of Interest		72.9	14	00.0%

Map Unit Legend

David Artz Site Evaluation January 29, 2020 Page 4 of 7

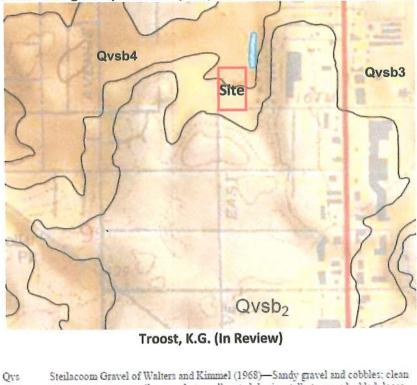

Geology

According to the USGS *Draft* Geologic Map of the Puyallup 7.5 Minute Quadrangle in Figure 2 below: this plateau region was formed by the gradual emplacement glacial drift stratigraphy; followed by the erosion of the previously emplaced glacial drift deposits by channelized glacial meltwater incision along the west side, and by ice lobe truncation within the Puyallup valley. The map shows that the slope section dipping to the northeast provides a depositional record of the pre-vashon mixed fine and coarse deposits, overlain by the Vashon advance outwash, overlain by the Vashon till, and finally overlain by the Vashon recessional outwash. The slope face represents the location where the much larger glacier within the valley truncated the slope face thus exposing a stratigraphic record of deposits. Figure 2 illustrates the site's position relative to the geology.

Hydrology

The NRCS along with soil logs prepared from the Tacoma-Pierce County Health Department (TPCHD) onsite septic system design documented the soil profiles as medium sand with gravel (ie: Everett 13B). These well drained soils existing on a rolling plain would suggest any precipitation entering the area can readily evacuate given the slope and high soil permeability. Isolated areas of surface perched water were observed across the northwest corner of the western lot. We do not see the conditions existing where large scale ground water buildup (and thus de-stabilizing pore pressure) can occur. David Artz Site Evaluation January 29, 2020 Page 5 of 7

USGS Geologic Map of the Puyallup 7.5 Minute Quadrangle (Excerpt)

<i>lt</i> .2	Steilacoom Grav	vel of Walters and Kimmel (1968)—Sandy gravel and cobbles; clean to silty; poorly to well sorted; horizontally to cross bedded; loose to dense. Deposits vary from veneer of 1 to 15 m (3 to ~ 50 ft) thick. Deposited by multiple outburst floods from subsequently lower elevations of Glacial Lake Puyallup. Locally subdivided first by channel affiliation (Clover Creek or Bradley) and secondarily by relative age in descending series of deposits; higher number denotes younger (lower) deposit. Clover Creek channel (Bretz, 1913) begins in section 8, T19N, R4E. Bradley channel; herein named for Lake Bradley in section 3, T19N, R4E; begins in section 2, T19N, R4E. Numbering system contiguous w'adjacent Tacoma South quadrangle where multiple Clover Creek deposits are mapped (Troost, 2006). Mapable deposits consist of:
	QVS cel	Clover Creek deposit at elevation ~380 ft
	QUSH	Bradley deposit at elevation ~400 ft
	QVS NJ	Bradley deposit at elevation 420 - 440 ft
	0019.5.5	Bradley deposit at elevation 440 - 460 ft

- Qvs b2 Bradley deposit at elevation 440 460 ft
- Qvs bl Bradley deposit at elevation 460 480 ft

Critical Area Review

On January 24th, 2020, site observations were made for the presence of indicators associated with landforms susceptible or undergoing mass movement due to a combination of geologic, seismic, topographic, hydrologic, or man-made factors. Per the *City of Puyallup Chapter 21.06 – "Critical Areas" (and specifically Section 21.06.1210);*

Geologically hazardous areas shall be classified as follows:

(a) Landslide and erosion hazard areas are areas of potential slope instability. Erosion hazard areas include those identified by the U.S. Department of Agriculture Natural Resources Conservation Service as having a moderate to severe, severe, or very severe erosion hazard because of natural characteristics, including vegetative cover, soil texture, slope, gradient, and rainfall patterns, or human-induced changes to natural characteristics. Landslide and erosion hazard areas include areas with the following characteristics:

(i) Areas that have shown mass movement during the Holocene epoch (from 10,000 years ago to the present) or that are underlain or covered by mass wastage debris of that epoch;

(ii) Slopes that are parallel or subparallel to planes of weakness (such as bedding planes, joint systems, and fault planes) in subsurface materials;

(iii) Slopes having gradients steeper than 80 percent subject to rock fall during seismic shaking;

(iv) Areas potentially unstable because of stream incision or stream bank erosion;

(v) Areas located in a canyon, ravine, or on an active alluvial fan, presently or potentially subject to inundation by debris flows or flooding;

(vi) Any area with a slope of 40 percent or steeper and a vertical relief of 10 or more feet, except areas composed of consolidated rock and properly engineered manmade slopes/retained fill. A slope is delineated by establishing its toe and top and measured by averaging the inclination over at least 10 feet of vertical relief;

(vii) Areas with a severe limitation for building development because of slope conditions, according to the Natural Resource Conservations Service; and

(viii) Areas meeting all three of the following criteria: (A) slopes steeper than 15 percent, except that slopes of less than 15 percent may be considered erosion hazard areas if they have certain unstable soil and drainage characteristics; (B) hillsides intersecting geologic contacts with a relatively permeable sediment overlying a relatively impermeable sediment or bedrock; and (C) wet season springs or ground water seepage.

Findings and Conclusions

In addition to the list of indicators above (i through viii), we reviewed published geologic maps, topographic maps, shaded relief maps, and aerial photography to form an opinion on slope morphology. We did not observe any of the potential landslide hazard indicators from the list above, nor does the landform show the classic, morphologic signatures associated with mass movement. This would be expected given that the angle of repose (the maximum angle at which a material is stable) has not been exceeded per our measurements.

Based on our observations and review of the published geology, soils, and topography, it is our opinion areas proposed for application of the on-site septic systems are stable landforms resulting from the depositional mechanisms contemporary with glacial meltwater. In our opinion, the slopes appear to be globally stable and not at risk for mass movement. The application of the on-site waste water will be David Artz Site Evaluation January 29, 2020 Page 7 of 7

designed in accordance with state and local design criteria based on the soil textures and application rate for the soil characteristics. The proposed drainfield areas are consistent with the design criteria and will not create an unstable condition.

Closure

The conclusions and recommendations presented in this letter are based, in part, on our interpretations and assumptions regarding subsurface conditions; therefore, if variations in the site conditions are observed at a later time, we may need to modify this letter to reflect those changes. We appreciate the opportunity to be of service on this project. If you have any questions regarding this letter or any aspects of the project, please feel free to contact our office.

Respectfully submitted,

Rex Humphrey, L.E.G. Engineering Geologist

Liquefaction Susceptibility Map of Pierce County, dated September 2004

Washington State Department of Ecology 2014 Stormwater Management Manual for Western Washington (2014 SWMMWW)

Dear Mr. Hebert:

As requested, Earth Solutions NW, LLC (ESNW) has prepared this letter for the proposed project. The letter was prepared in general accordance with the scope of services outlined in our proposal dated November 15, 2021, which was authorized by you on November 19, 2021. A summary of the subsurface explorations on site and geotechnical recommendations to aid with site design are provided in this letter.

Project Description

According to the referenced site plan, the currently unimproved site will be developed with two duplex structures, proposed within roughly the southern quarter of the site, along with associated improvements. Each duplex will be two stories. Four dispersion trenches (with 50-foot flowpaths toward the wetland) and an infiltration gallery are proposed. It is noted that, per discussion with the civil engineer, certain elements of design and/or the site layout (as shown on the referenced site plan) had not been finalized as of the date of this letter, including the driveway layout and the locations of the dispersion trenches and infiltration gallery. A 60-foot wetland buffer has been incorporated into the site plan.

Surface Conditions

The subject site is located on the north side of 43rd Avenue Southwest, between 98th Avenue East and 99th Avenue Court East, in Puyallup, Washington. The approximate location of the property is illustrated on Plate 1 (Vicinity Map). The site consists of two adjacent tax parcels (Pierce County Parcel No. 041909-5003 and -5022), totaling roughly 2.5 acres. The existing topography descends generally from south to north, with an estimated 10 to 15 feet of elevation change across the parcels. A wetland and associated buffer encompass most of the site, with only the southern site area and eastern site margin located outside of the wetland and buffer. The site is moderately to heavily vegetated and undeveloped.

Subsurface Conditions

An ESNW representative observed, logged, and sampled five test pits on December 8, 2021. Four additional test pits, three of which had standpipe piezometers installed for seasonal groundwater monitoring purposes, were excavated on January 13, 2022. The test pits were excavated within accessible site areas, using a mini trackhoe and operator retained by ESNW. The test pits were completed to evaluate and classify site soils, characterize groundwater conditions within accessible site areas, and perform in-situ infiltration testing.

The approximate locations of the test pits are depicted on Plate 2 (Test Pit Location Plan). Please refer to the attached test pit logs for a more detailed description of subsurface conditions. Representative soil samples collected at the test pit locations were analyzed in general accordance with both Unified Soil Classification System (USCS) and USDA methods and procedures.

Topsoil and Fill

Where encountered at surface grades, the topsoil was about six to eight inches thick. The topsoil was characterized by the observed dark brown hue, the presence of fine organics, and small root intrusions.

Fill was encountered at test pit locations TP-2, TP-3, TP-4, TP-5, TP-8, and TP-9 to depths of about six to nine-and-one-half feet below the existing ground surface (bgs). The fill was characterized as silty sand with and without gravel, primarily in a loose to medium dense and damp to moist condition. Small pieces of asphalt, wood, and plastic were observed in the fill.

Native Soil

Underlying the topsoil and fill, native soil consisted primarily of silty sands with gravel (USCS: SM), with well-graded gravels with sand (USCS: GW) present along the western end of the site. The in-situ density of the native soil was characterized primarily as medium dense to dense, and the in-situ moisture content was observed to be damp to wet at the time of exploration. The maximum exploration depth was approximately 11 feet bgs.

Geologic Setting

The referenced geologic map resource identifies recessional outwash (Qgo) as the primary native soil unit underlying the subject site and proximate areas. As reported on the geologic map resource, recessional outwash is typically composed of silts, sands, and gravels deposited by glacial meltwater. The referenced WSS resource identifies Everett very gravelly sandy loam as the primary soil unit underlying the subject development area. The Everett series was formed in glacial drift plains. Based on our field observations, the on-site native soil is consistent with the local geologic mapping of recessional outwash.

Groundwater

The groundwater table was encountered at test pits TP-1, TP-2, TP-4, and TP-7 during the December 2021 and January 2022 explorations. At the time of the explorations, the groundwater table was observed at depths of about 8 to 11 feet bgs. Shallow groundwater seepage was observed at TP-6 at a depth of roughly seven feet bgs during the January 2022 exploration.

To supplement the field observations, ESNW was contracted to complete a groundwater monitoring program through most of the 2021–2022 wet season. The program consisted of installing three standpipe piezometers (at TP-6, TP-8, and TP-9) for groundwater monitoring purposes. The piezometers were arranged in a triangular array across the proposed development area.

After the installation of the groundwater wells on January 13, 2022, ESNW personnel visited the site periodically (about twice per month), through the end of the wet season, to collect data and perform manual measurements at each monitoring location using a depth-to-water meter. Upon review of the data collected at the piezometers using dataloggers, it was determined the data was corrupt and unreliable, e.g., the dataloggers were indicating groundwater levels far shallower than those measured manually. As such, the manual measurements were relied upon for purposes of evaluating the seasonal high groundwater table. The tables below summarize the groundwater data collected during the monitoring program.

Test Pit	Depth of Test Pit (ft)	Ground Elevation* (ft)	Peak GWT Depth (ft bgs)	Peak GWT Elevation* (ft)	Peak Date
TP-6	8.0	434	6.75	427.25	03/17/2022
TP-8	7.5	435	N/A	N/A	N/A
TP-9	9.0	435	N/A	N/A	N/A

* Ground elevations are approximate and based on readily available topographic survey data. The test pit locations were not surveyed.

Date of Manual Measurement	TP-6 GWT (ft bgs)	TP-8 GWT (ft bgs)	TP-9 GWT (ft bgs)
01/13/2022	(Dry)	(Dry)	(Dry)
02/04/2022	7.1	(Dry)	(Dry)
02/24/2022	7.0	(Dry)	(Dry)
03/17/2022	6.7	(Dry)	(Dry)
04/07/2022	6.9	(Dry)	(Dry)

Based on our field observations and monitoring, the following recommendations are offered:

- Groundwater was not observed within the monitored depths of the standpipe piezometers at TP-8 and TP-9. Therefore, it is our opinion the seasonal high groundwater table elevation occurs at a depth of not higher than 7.5 feet bgs in the south-central and southeast areas of the site.
- The recommended seasonal high groundwater table elevation within the southwest site area (near TP-6) is 6.7 feet bgs.

Geologically Hazardous Areas

ESNW reviewed the referenced Puyallup Municipal Code (PMC) chapter and the City of Puyallup interactive GIS resource to evaluate the presence of geologically hazardous areas on site. PMC 21.06.1210 recognizes erosion, landslide, seismic, and volcanic hazard areas as geologically hazardous. Based on our review, a small area of moderate (shallow) landslide hazard is mapped on site. The location of the mapped hazard area appears to coincide with the location of the wetland. No other geologically hazardous areas are recognized or mapped on site.

Landslide hazard areas are defined in PMC 21.06.1210(3)(b) as areas subject to landslides based on a combination of geologic, topographic, and hydrologic factors. The most relevant hazard criteria to the subject site include PMC 21.06.1210(3)(b)(ii) and 21.06.1210(3)(b)(ix), which characterize landslide hazard (in part) by slope gradient. Based on review of the referenced site plan, the site does not contain slopes steeper than 15 percent over a vertical relief of 10 feet. As such, it is our opinion the site does not meet the PMC definition of a landslide hazard area.

According to PMC 21.06.1210(3)(c), seismic hazard areas are defined as "areas subject to severe risk of damage as a result of earthquake-induced ground shaking, slope failure, settlement or subsidence, soil liquefaction, or tsunamis." The referenced liquefaction susceptibility map indicates the site and surrounding areas possess very low liquefaction susceptibility. Based on our field observations, it is our opinion that the site is correctly mapped as not located within a seismic hazard area.

Geotechnical Recommendations

Based on our investigation, the proposed residential development is feasible from a geotechnical standpoint. The primary geotechnical considerations for the proposal are associated with structural fill placement and compaction, earthwork and grading activities, foundation support, stormwater management, and drainage. Based on our field observations and understanding of the proposed development, pertinent geotechnical recommendations and design parameters are presented in the following sections.

In-situ and Imported Soil

From a geotechnical standpoint, in general, our field observations indicate on-site soils likely to be encountered during construction will not be suitable for use as structural fill unless the in-situ soil moisture content is at (or slightly above) the optimum level at the time of placement and compaction. Successful use of on-site soils as structural fill will largely be dictated by the moisture content at the time of placement and compaction. It should be noted that most of the on-site soil is moisture sensitive (silty sand). However, areas of well-drained gravels, where encountered, are not considered moisture sensitive.

As discussed in the *Topsoil and Fill* section above, artificial fill soils were encountered at several test locations. Various amounts of debris, including asphalt, wood, and plastic were observed in the fill. To be suitable for reuse as structural fill, the existing fill must be primarily free of debris (both organic and inorganic) and deleterious material; as such, efforts to screen and remove the observed debris should be incorporated into construction activities if the existing fill will be considered for reuse as structural fill. ESNW should be retained to observe earthwork, grading, and/or screening activities pertaining to the existing fill during construction, as necessary.

Performing grading activities during summer months of relatively low rainfall activity is recommended to minimize site degradation. In our opinion, a contingency should be provided in the project budget for the export of soil that cannot be successfully compacted as structural fill, particularly if grading activities take place during periods of extended rainfall activity. In general, soil with an appreciable fines content (greater than 5 percent) typically degrades rapidly when exposed to periods of rainfall.

Imported soil intended for use as structural fill should be evaluated by ESNW during construction. The imported soil must be able to achieve the necessary moisture content, as determined by the Modified Proctor Method (ASTM D1557), at the time of placement and compaction. During wet weather conditions, imported soil intended for use as structural fill should consist of a well-graded, granular soil with a fines content of 5 percent or less (where the fines content is defined as the percent passing the Number 200 sieve, based on the minus three-quarter-inch fraction).

Structural Fill

Structural fill is defined as compacted soil placed in foundation, slab-on-grade, roadway, permanent slope, retaining wall, and utility trench backfill areas. Structural fill placed and compacted during site grading activities should meet the following specifications:

٠	Structural fill material	Granular soil
•	Moisture content	At or slightly above optimum
•	Relative compaction (minimum)	95 percent (Modified Proctor)
•	Loose lift thickness (maximum)	12 inches

The existing soil may not be suitable for use as structural fill unless the in-situ moisture content is at (or slightly above) the optimum moisture content at the time of placement and compaction. Soil shall not be placed dry of the optimum moisture content and should be evaluated by ESNW during construction. With respect to underground utility installations and backfill, local jurisdictions may dictate the soil type(s) and compaction requirements. Unsuitable material or debris must be removed from structural areas, if encountered.

Foundations

The proposed residential structures may be supported on conventional continuous and spread footing foundations bearing on either suitably compact structural fill or competent native soil. Because the existing fill thicknesses across the site are relatively significant, it is difficult to estimate a consistent depth where suitable bearing soil is likely to be encountered. For preliminary design purposes, ESNW recommends an overexcavation depth of two feet as well as placement of a biaxial geotextile at the overexcavated subgrade elevation be incorporated into the plans.

Existing fill intended for reuse as structural fill must be free of debris and should be evaluated by ESNW prior to use. In general, if loose or unsuitable soil conditions are exposed at foundation subgrade elevations, additional mechanical compactive effort or overexcavation and replacement with suitable structural fill will likely be necessary.

Provided foundations will be supported as prescribed, the following parameters may be used for design:

Allowable soil bearing capacity	2,500 psf
Passive earth pressure	300 pcf (equivalent fluid)
Coefficient of friction	0.40

A one-third increase in the allowable soil bearing capacity may be assumed for short-term wind and seismic loading conditions. The above passive pressure and friction values include a factorof-safety of 1.5. With structural loading as expected, about one inch of total static settlement and about one-half inch of differential static settlement is anticipated. Most of the anticipated settlement should occur during construction when dead loads are applied.

Seismic Design

The 2018 International Building Code (2018 IBC) recognizes the most recent edition of the Minimum Design Loads for Buildings and Other Structures manual (ASCE 7-16) for seismic design, specifically with respect to earthquake loads. Based on the soil conditions encountered at the test pit locations, the parameters and values provided below are recommended for seismic design per the 2018 IBC.

Parameter	Value
Site Class	D*
Mapped short period spectral response acceleration, $S_S(g)$	1.262
Mapped 1-second period spectral response acceleration, $S_1(g)$	0.436
Short period site coefficient, Fa	1.0
Long period site coefficient, F_v	1.864†
Adjusted short period spectral response acceleration, S_{MS} (g)	1.262
Adjusted 1-second period spectral response acceleration, $S_{M1}(g)$	0.813†
Design short period spectral response acceleration, $S_{DS}(g)$	0.841
Design 1-second period spectral response acceleration, $S_{D1}(g)$	0.542†

* Assumes dense native soil conditions, encountered to a maximum depth of 11 feet bgs during the December 2021 and January 2022 field explorations, remain dense to at least 100 feet bgs.

† Values assume F_v may be determined using linear interpolation per Table 11.4-2 in ASCE 7-16.

As indicated in the table footnote, several of the seismic design values provided above are dependent on the assumption that site-specific ground motion analysis (per Section 11.4.8 of ASCE 7-16) will not be required for the subject project. ESNW recommends the validity of this assumption be confirmed at the earliest available opportunity during the planning and early design stages of the project. Further discussion between the project structural engineer, the project owner, and ESNW may be prudent to determine the possible impacts to the structural design due to increased earthquake load requirements under the 2018 IBC. ESNW can provide additional consulting services to aid with design efforts, including supplementary geotechnical and geophysical investigation, upon request.

Liquefaction is a phenomenon where saturated or loose soil suddenly loses internal strength and behaves as a fluid. This behavior is in response to increased pore water pressures resulting from an earthquake or another source of intense ground shaking. As mentioned in the *Geologically Hazardous Areas* section of this letter, it is our opinion site susceptibility to liquefaction is low. The relatively consistent density of the native soils was the primary basis for this opinion.

Slab-on-Grade Floors

Slab-on-grade floors for the proposed residential structure should be supported on firm and unyielding subgrades comprised of competent native soil, compacted structural fill, or new structural fill. Unstable or yielding subgrade areas should be recompacted or overexcavated and replaced with suitable structural fill prior to slab construction.

A capillary break, consisting of at least four inches of free-draining crushed rock or gravel, should be placed below each slab. The free-draining material should have a fines content of 5 percent or less (where the fines content is defined as the percent passing the Number 200 sieve, based on the minus three-quarter-inch fraction). In areas where slab moisture is undesirable, installation of a vapor barrier below each slab should be considered. If a vapor barrier is to be utilized, it should be a material specifically designed for use as a vapor barrier and should be installed in accordance with the specifications of the manufacturer.

Retaining Walls

Retaining walls must be designed to resist earth pressures and applicable surcharge loads. The following parameters may be used for design:

Active earth pressure (unrestrained condition)	35 pcf (equivalent fluid)
At-rest earth pressure (restrained condition)	55 pcf
 Traffic surcharge* (passenger vehicles) 	70 psf (rectangular distribution)
Passive earth pressure	300 pcf (equivalent fluid)
Coefficient of friction	0.40
Seismic surcharge	8H psf [†]

* Where applicable.

† Where H equals the retained height (in feet).

The above design parameters are based on a level backfill condition and level grade at the wall toe. Revised design values will be necessary if sloping grades are to be used above or below retaining walls. Additional surcharge loading from adjacent foundations, sloped backfill, or other relevant loads should be included in the retaining wall design.

Retaining walls should be backfilled with free-draining material that extends along the height of the wall and a distance of at least 18 inches behind the wall. The upper 12 inches of the wall backfill may consist of a less permeable soil, if desired. A perforated drainpipe should be placed along the base of the wall and connected to an approved discharge location. A typical retaining wall drainage detail is provided on Plate 3. If drainage is not provided, hydrostatic pressures should be included in the wall design.

Drainage

Groundwater will likely be encountered in site excavations, especially those necessary to construct utility trenches. Temporary measures to control surface water runoff and groundwater during construction would likely involve interceptor trenches and sumps. ESNW should be consulted during preliminary grading to both identify areas of seepage and provide recommendations to reduce the potential for seepage-related instability.

Finish grades must be designed to direct surface drain water away from structures and slopes. Water must not be allowed to pond adjacent to structures. In our opinion, foundation drains should be installed along building perimeter footings. A typical foundation drain detail is provided on Plate 4.

Infiltration Evaluation

In accordance with the requirements of the referenced 2014 SWMMWW, which is adopted by the City of Puyallup, one small-scale Pilot Infiltration Test (PIT) was completed during the January 2022 fieldwork. The PIT was completed at TP-7 at a depth of about four feet bgs. Per the 2014 SWMMWW, the measured infiltration rate must be reduced by correction factors that account for site variability and number of locations tested (CF_v), test method (CF_t), and the degree of influent control to prevent siltation and bio-buildup (CF_m). The following is a summary of the measured rate, applicable correction factors, and the recommended design rate:

 K_{sat} initial (measured rate at TP-7) 	600 inches per hour (in/hr)
• CFt	0.5 (small-scale PIT)
• CF _v	0.7
• CFm	0.9
• K _{sat} design (calculated rate)	30 in/hr*

* Recommended maximum (capped) design infiltration rate.

HC Homes, Inc. March 30, 2023

Based on the field investigations, the above infiltration rate is applicable only within the southwest site corner (in the area of TP-1, TP-6, and TP-7). Elsewhere on site, infiltration is not feasible from a geotechnical standpoint given the widespread existing fill and the presence of relatively impermeable native soil at depth.

ESNW should be contacted to review stormwater management plans if infiltration is used for design. Supplementary recommendations and/or testing may be necessary depending on the size, depth, and siting of infiltration facilities.

Dispersion Feasibility

Based on our field observations of on-site conditions and the subsurface makeup, it is our opinion that dispersion is feasible from a geotechnical standpoint. The erosion potential of the vegetated flow paths can be considered low provided proper vegetation is maintained and/or reestablished (as needed). This opinion is based on the depicted siting of the dispersion trenches (per the referenced site plan) and the relatively stable nature of the native soils, which are not likely to be adversely affected from a dispersion scheme. Where fill will be present underlying dispersion systems, ESNW should be contacted to review the proposed layouts and provide recommendations, as necessary, to ensure adequate long-term performance. We anticipate a portion of the outflow will infiltrate into the substratum as interflow.

Limitations & Additional Services

This letter has been prepared for the exclusive use of HC Homes, Inc., and its representatives. No warranty, express or implied, is made. The recommendations and conclusions provided in this letter are professional opinions consistent with the level of care and skill that is typical of other members in the profession currently practicing under similar conditions in this area. Variations in the soil and groundwater conditions encountered at the test pit locations may exist and may not become evident until construction. ESNW should reevaluate the contents of this letter if variations are encountered during construction, or if the design assumptions outlined herein either change or are incorrect.

ESNW should have an opportunity to review final project plans with respect to the geotechnical recommendations provided in this report. ESNW should also be retained to provide testing and consultation services during construction. Provided that ESNW is retained during construction, we can provide supplementary geotechnical recommendations, as necessary, where differing soil conditions are encountered.

HC Homes, Inc. March 30, 2023 ES-8303 Page 11

We trust this letter meets your current needs. Please call if you have any questions about this letter or if we can be of further assistance.

Sincerely,

EARTH SOLUTIONS NW, LLC

till
