

**East Town Crossing - 22S075 - Field Report: Geotechnical consulting: Report #F279450**

**CLIENT** Dan Lloyd **DATE** 04/13/2022  
**PROJECT LOCATION** Intersection of Shaw Road East and East Pioneer Puyallup **PERMIT #**  
WA 98372

**Inspection Information:**

**Inspection Date:** 04/13/2022 **Time Onsite:** N/A **Weather Conditions:** N/A  
**Inspection Performed:** Geotechnical consulting

**Comments:**

**Infiltration Testing Report with Corrected Infiltration Rates - REVISED on 04/18/2022.**

On April 1, 2022, MTC Staff Geologist visited the site to perform limited shallow infiltration testing in accordance with the Falling Head Percolation Test Procedure (US EPA 1980), as requested by the contractor, in order to demonstrate that the selected import soil, Des Moines Pit Run w/ Glass (33%), generally conforms with design infiltration rates of 2.0 in/hr.

At the time of testing, the Contractor had prepared and compacted four (4) testing pads, approximately 12 to 18 inches thick and 5' L x 5' W, prior to MTC's arrival. MTC conducted a total of three (3) falling head infiltration tests between two (2) locations on each pad. Testing locations were free of standing water at the time of our visit. Holes were prepared in accordance with EPA standards. The prescribed soaking period was determined to be unnecessary based on the sandy/gravelly nature of the soils. Testing locations were continuously observed to measure cumulative head fall. A field report containing the initial, uncorrected infiltration rates of all four (4) of the tested soils was completed previously (MTC Report #F278686).

The infiltration rates of the Selected Import Soil (Des Moines Pit Run w/ Glass) can be found below:

**Des Moines Pit Run w/ Glass (33%) - Field test results of this soil yielded average uncorrected field infiltration rate of:**

- 164.1 in/hr.

All field test results are to be further reduced by correction factors by the Geotechnical Engineer of Record as stipulated in the locally-accepted stormwater manual. Utilizing the average uncorrected value(s) and applying the correction factors of  $CF_v = 0.33$ ,  $CF_t = 0.40$ ,  $CF_m = 0.90$  for the selected soil yields **corrected field infiltration rate** of:

- 19.50 in/hr

**Which meets/exceeds the project design infiltration rate of 2.0 in/hr.**

**NOTES:**

1) MTC assumes the project civil engineer will review to confirm these findings and evaluate final correction factors, if necessary. MTC also assumes these results to be preliminary, for permit approval only. Final infiltration testing should be conducted on the compacted soils after placement.

As a mutual protection to clients, the public and ourselves, all reports are submitted as the confidential property of clients, and authorization for publication of statements, conclusions or extracts from or regarding our reports is reserved pending our written approval.

[www.mtc-inc.net](http://www.mtc-inc.net)

2) MTC's assessment did not include: evaluation of underlying soil consistency or variability, mounding analysis, verification of depth to a static water level, or depth to impermeable soil units. Falling Head tests are limited but typically considered suitable for confirmation of infiltration potential is reasonably consistent soil conditions with no confining soils or shallow water table. If greater confidence or accuracy is required, further testing may be necessary.

3) Refer to MTC Report No. F287686 for pictures of the testing.

REPORTED BY: Marcus Van Valen

REVIEWED BY: Medhanie Tecele, Project Manager

## Correction Factor For Infiltration Testing

Total Correction Factor Determination using 2019 Stormwater Management Manual for Western Washington Volume V - Chapter 5 - Page 736 - Table V-5.1.

Site Variability:  $CF_V = 0.33$  (Uncertain Risk is Very Low)

Testing Method:  
Falling Head:  $CF_t = 0.40$

Degree of Influent Control:  $CF_M = 0.9$

Total Correction Factor Equation:  $CF_T = CF_V \times CF_t \times CF_M$

$$0.1188 = 0.33 \times 0.40 \times 0.90$$

Des Moines Soil Testing: **Des Moines Pit Run w/ Glass (33%)**

$K_{sat}$  : 112.5 in/hr  
174.2 in/hr  
207.7 in/hr

\*Average: 164.13 in/hr

Correction Factor Equation

$$K_{sat \text{ design}} = K_{sat} \times CF_T$$

Test #1: 13.37 in/hr = 112.5 x 0.1188

Test #2: 20.69 in/hr = 174.2 x 0.1188

Test #3: 24.44 in/hr = 205.7 x 0.1188

Average: 19.50 in/hr = 164.13 x 0.1188

Projected Infiltration Design Rate  
Based on Table V.5.1

**Table V-5.1: Correction Factors to be Used With In-Situ Saturated Hydraulic Conductivity Measurements to Estimate Design Rates**

Issue	Partial Correction Factor
Site variability and number of locations tested	$CF_V = 0.33$ to 1.0
<b>Test Method</b>	
<ul style="list-style-type: none"> <li>• Large-scale PIT</li> <li>• Small-scale PIT</li> <li>• Other small-scale (e.g. Double ring, falling head)</li> <li>• Grain Size Method</li> </ul>	<ul style="list-style-type: none"> <li>• <math>CF_t = 0.75</math></li> <li>• = 0.50</li> <li>• = 0.40</li> <li>• = 0.40</li> </ul>
Degree of influent control to prevent siltation and bio-buildup	$CF_M = 0.9$

Total Correction Factor,  $CF_T = CF_V \times CF_t \times CF_M$

- The design infiltration rate ( $K_{sat \text{ design}}$ ) is calculated by multiplying the initial  $K_{sat}$  by the total correction factor:

$$K_{sat \text{ design}} = K_{sat \text{ initial}} \times CF_T$$

## Des Moines Pit Run w/ Glass (33%)

<b>Client:</b> Dan Lloyd	<b>Date:</b> April 14, 2022
<b>Address:</b> Intersection Of Shaw Road East	<b>Project:</b> East Town Crossing
<b>Attn:</b> Dan Lloyd	<b>Project #:</b> 22S075
	<b>Sample #:</b> S22-0107
	<b>Date Sampled:</b> April 12, 2014

As requested MTC, Inc. has performed the following test(s) on the sample referenced above. The testing was performed in accordance with current applicable AASHTO or ASTM standards as indicated below. The results obtained in our laboratory were as follows below or on the attached pages:

Test(s) Performed:	Test Results	Test(s) Performed:	Test Results
X Sieve	See Test Report	Sulfate Soundness	
X Proctor	137.9 @ 7.5 % R.C.	Bulk Density & Voids	
Sand Equivalent		WSDOT Degradation	
Fracture Count		CEC	
Moisture Content		Organic Content	
Specific Gravity, Coarse			
Specific Gravity, Fine			
Hydrometer Analysis			
Atterberg Limits			
Asphalt Extraction/Gradation			
Rice Density			

If you have any questions concerning the test results, the procedures used, or if we can be of any further assistance please call on us at the number below.

Respectfully Submitted,

# East Town Crossing - 22S075 - Field Report: Geotechnical consulting: Report #F278686

**CLIENT** Dan Lloyd **DATE** 04/01/2022  
**PROJECT LOCATION** Intersection of Shaw Road East and East Pioneer Puyallup **PERMIT #**  
WA 98372

## Inspection Information:

**Inspection Date:** 04/01/2022 **Time Onsite:** 1100 **Weather Conditions:** 50F, Partly Cloudy

**Inspection Performed:** Geotechnical consulting

### Comments:

#### Report of Infiltration Test - Infiltration

MTC Staff Geologist visited the site to perform limited shallow infiltration testing in accordance with the Falling Head Percolation Test Procedure (US EPA 1980), as requested by the contractor, in order to demonstrate that the import soils generally conform with design infiltration rates.

Contractor had prepared and compacted four (4) testing pads, approximately 12 to 18 inches thick and 5'L x 5'W, prior to MTC's arrival. MTC conducted a total of three (3) falling head infiltration tests between two (2) locations on each pad. Testing locations were free of standing water at the time of our visit. Holes were prepared in accordance with EPA standards. The prescribed soaking period was determined to be unnecessary based on the sandy/gravelly nature of the soils. Testing locations were continuously observed to measure cumulative head fall.

**Des Moines Pit Run w/ Glass (33%)** - These observed import soils appeared to be moderately-well draining, Well-Graded Sand with moderate amounts of gravel and cobbles, some fines content, and a significant amount of glass shards.

- Field test results of this soil yielded **uncorrected** field infiltration rates of:
  - 205.7 in/hr
  - 112.5 in/hr
  - 174.2 in/hr

**SOILS TO BE USED AS ENGINEERED FILL**

**Miles Pit Run - Gravel Borrow** - These observed import soils appeared to be moderately-well draining, Poorly-Graded gravel with a moderate amount of sand and few fines.

- Field test results of this soil yielded **uncorrected** field infiltration rates of:
  - 480.0 in/hr
  - 240.0 in/hr
  - 348.4 in/hr

**Miles Pit Run - Gravel Borrow w/ Glass** - These observed import soils appeared to be moderately-well draining, Poorly-Graded gravel with a moderate amount of sand, few fines and some glass shards.

- Field test results of this soil yielded **uncorrected** field infiltration rates of:
  - 981.8 in/hr
  - 617.1 in/hr
  - 674.5 in/hr

**Corliss/Miles Gravel Borrow Mix** - These observed import soils appeared to be moderately-well draining, Poorly-Graded Sand with Gravel and few fines.

- Field test results of this soil yielded **uncorrected** field infiltration rates of:
  - 106.4 in/hr
  - 322.4 in/hr
  - 225.0 in/hr

[www.mtc-inc.net](http://www.mtc-inc.net)

All field test results are to be further reduced by correction factors by the Geotechnical Engineer of Record as stipulated in the locally-accepted stormwater manual, utilizing a minimum safety factor of 0.5.

**Uncorrected field test results** indicate the maximum design infiltration rate of **30 in/hr** may be used for each of the import soils.

\*\*MTC's assessment did not include: evaluation of underlying soil consistency or variability, mounding analysis, verification of depth to a static water level, or depth to impermeable soil units. Falling Head tests are limited but typically considered suitable for confirmation of infiltration potential is reasonably consistent soil conditions with no confining soils or shallow water table. If greater confidence or accuracy is required, further testing may be necessary.\*\*

**MTC assumes the geotechnical engineer of record, and project civil engineer will review to confirm these findings and evaluate final correction factors if necessary.**
